## 1 Foreword

### **1.1** Notes on the documentation

#### Intended audience

This description is only intended for the use of trained specialists in control and automation engineering who are familiar with the applicable national standards.

It is essential that the documentation and the following notes and explanations are followed when installing and commissioning these components.

The qualified personnel is obliged to always use the currently valid documentation.

The responsible staff must ensure that the application or use of the products described satisfy all the requirements for safety, including all the relevant laws, regulations, guidelines and standards.

#### Disclaimer

The documentation has been prepared with care. The products described are, however, constantly under development.

We reserve the right to revise and change the documentation at any time and without prior announcement.

No claims for the modification of products that have already been supplied may be made on the basis of the data, diagrams and descriptions in this documentation.

#### Trademarks

Beckhoff<sup>®</sup>, TwinCAT<sup>®</sup>, TwinCAT/BSD<sup>®</sup>, TC/BSD<sup>®</sup>, EtherCAT<sup>®</sup>, EtherCAT G<sup>®</sup>, EtherCAT G10<sup>®</sup>, EtherCAT P<sup>®</sup>, Safety over EtherCAT<sup>®</sup>, TwinSAFE<sup>®</sup>, XFC<sup>®</sup>, XTS<sup>®</sup> and XPlanar<sup>®</sup> are registered trademarks of and licensed by Beckhoff Automation GmbH. Other designations used in this publication may be trademarks whose use by third parties for their own purposes could violate the rights of the owners.

#### **Patent Pending**

The EtherCAT Technology is covered, including but not limited to the following patent applications and patents: EP1590927, EP1789857, EP1456722, EP2137893, DE102015105702 with corresponding applications or registrations in various other countries.

EtherCAT<sup>®</sup> is registered trademark and patented technology, licensed by Beckhoff Automation GmbH, Germany.

#### Copyright

© Beckhoff Automation GmbH & Co. KG, Germany.

The reproduction, distribution and utilization of this document as well as the communication of its contents to others without express authorization are prohibited.

Offenders will be held liable for the payment of damages. All rights reserved in the event of the grant of a patent, utility model or design.

## 1.2 Safety instructions

#### Safety regulations

Please note the following safety instructions and explanations! Product-specific safety instructions can be found on following pages or in the areas mounting, wiring, commissioning etc.

#### **Exclusion of liability**

All the components are supplied in particular hardware and software configurations appropriate for the application. Modifications to hardware or software configurations other than those described in the documentation are not permitted, and nullify the liability of Beckhoff Automation GmbH & Co. KG.

#### **Personnel qualification**

This description is only intended for trained specialists in control, automation and drive engineering who are familiar with the applicable national standards.

#### Signal words

The signal words used in the documentation are classified below. In order to prevent injury and damage to persons and property, read and follow the safety and warning notices.

#### Personal injury warnings

Hazard with high risk of death or serious injury.					
Hazard with medium risk of death or serious injury.					
There is a low-risk hazard that could result in medium or minor injury.					

#### Warning of damage to property or environment

NOTICE

The environment, equipment, or data may be damaged.

#### Information on handling the product

This information includes, for example:

recommendations for action, assistance or further information on the product.

## **1.3** Documentation issue status

Version	Comment
2.4	Chapter "Recommended mounting rails" removed
	Update chapter "Technical data"
	Chapter "IECEx - Special conditions" added
	Update revision status
2.3	Update chapter "Technical data"

1.1	Corrections to chapter "Mounting and wiring"
1.0	Corrections and addenda, first publication
0.2	Corrections and addenda
0.1	Preliminary version for internal use

## 1.4 Version identification of EtherCAT devices

### 1.4.1 General notes on marking

#### Designation

A Beckhoff EtherCAT device has a 14-digit designation, made up of

- · family key
- type
- version
- revision

Example	Family	Туре	Version	Revision
EL3314-0000-0016	EL terminal	3314	0000	0016
	12 mm, non-pluggable connection level	4-channel thermocouple terminal	basic type	
ES3602-0010-0017	ES terminal	3602	0010	0017
	12 mm, pluggable connection level	2-channel voltage measurement	high-precision version	
CU2008-0000-0000	CU device	2008	0000	0000
		8-port fast ethernet switch	basic type	

#### Notes

- The elements mentioned above result in the **technical designation**. EL3314-0000-0016 is used in the example below.
- EL3314-0000 is the order identifier, in the case of "-0000" usually abbreviated to EL3314. "-0016" is the EtherCAT revision.
- The order identifier is made up of
  - family key (EL, EP, CU, ES, KL, CX, etc.)
  - type (3314)
  - version (-0000)
- The **revision** -0016 shows the technical progress, such as the extension of features with regard to the EtherCAT communication, and is managed by Beckhoff.

In principle, a device with a higher revision can replace a device with a lower revision, unless specified otherwise, e.g. in the documentation.

Associated and synonymous with each revision there is usually a description (ESI, EtherCAT Slave Information) in the form of an XML file, which is available for download from the Beckhoff web site. From 2014/01 the revision is shown on the outside of the IP20 terminals, see Fig. *"EL5021 EL terminal, standard IP20 IO device with batch number and revision ID (since 2014/01)"*.

• The type, version and revision are read as decimal numbers, even if they are technically saved in hexadecimal.

### 1.4.2 Version identification of EL terminals

The serial number/ data code for Beckhoff IO devices is usually the 8-digit number printed on the device or on a sticker. The serial number indicates the configuration in delivery state and therefore refers to a whole production batch, without distinguishing the individual modules of a batch.

Structure of the serial number: KK YY FF HH

- KK week of production (CW, calendar week)
- YY year of production
- FF firmware version

BECKHOFF

HH - hardware version

Fig. 1: EL2872 with revision 0022 and serial number 01200815

Example with serial number 12 06 3A 02:

- 12 production week 12
- 06 production year 2006
- 3A firmware version 3A
- 02 hardware version 02

### **1.4.3 Beckhoff Identification Code (BIC)**

The Beckhoff Identification Code (BIC) is increasingly being applied to Beckhoff products to uniquely identify the product. The BIC is represented as a Data Matrix Code (DMC, code scheme ECC200), the content is based on the ANSI standard MH10.8.2-2016.

Fig. 2: BIC as data matrix code (DMC, code scheme ECC200)

The BIC will be introduced step by step across all product groups.

Depending on the product, it can be found in the following places:

- · on the packaging unit
- directly on the product (if space suffices)
- on the packaging unit and the product

The BIC is machine-readable and contains information that can also be used by the customer for handling and product management.

Each piece of information can be uniquely identified using the so-called data identifier (ANSI MH10.8.2-2016). The data identifier is followed by a character string. Both together have a maximum length according to the table below. If the information is shorter, spaces are added to it.

Following information is possible, positions 1 to 4 are always present, the other according to need of production:

Posi- tion	Type of information	Explanation	Data identifier	Number of digits incl. data identifier	Example
1	Beckhoff order number	Beckhoff order number	1P	8	1P072222
2	Beckhoff Traceability Number (BTN <b>)</b>	Unique serial number, see note below	SBTN	12	<mark>S</mark> BTNk4p562d7
3	Article description	Beckhoff article description, e.g. EL1008	1K	32	<mark>1K</mark> EL1809
4	Quantity	Quantity in packaging unit, e.g. 1, 10, etc.	Q	6	Q1
5	Batch number	Optional: Year and week of production	2P	14	2P401503180016
6	ID/serial number	Optional: Present-day serial number system, e.g. with safety products	51S	12	<mark>51S</mark> 678294
7	Variant number	Optional: Product variant number on the basis of standard products	30P	32	30PF971, 2*K183

Further types of information and data identifiers are used by Beckhoff and serve internal processes.

#### Structure of the BIC

Example of composite information from positions 1 to 4 and with the above given example value on position 6. The data identifiers are highlighted in bold font:

1P072222SBTNk4p562d71KEL1809 Q1 51S678294

Accordingly as DMC:

Fig. 3: Example DMC 1P072222SBTNk4p562d71KEL1809 Q1 51S678294

#### BTN

An important component of the BIC is the Beckhoff Traceability Number (BTN, position 2). The BTN is a unique serial number consisting of eight characters that will replace all other serial number systems at Beckhoff in the long term (e.g. batch designations on IO components, previous serial number range for safety products, etc.). The BTN will also be introduced step by step, so it may happen that the BTN is not yet coded in the BIC.

#### NOTICE

This information has been carefully prepared. However, the procedure described is constantly being further developed. We reserve the right to revise and change procedures and documentation at any time and without prior notice. No claims for changes can be made from the information, illustrations and descriptions in this information.

### 1.4.4 Electronic access to the BIC (eBIC)

#### Electronic BIC (eBIC)

The Beckhoff Identification Code (BIC) is applied to the outside of Beckhoff products in a visible place. If possible, it should also be electronically readable.

Decisive for the electronic readout is the interface via which the product can be electronically addressed.

#### K-bus devices (IP20, IP67)

Currently, no electronic storage and readout is planned for these devices.

#### EtherCAT devices (IP20, IP67)

All Beckhoff EtherCAT devices have a so-called ESI-EEPROM, which contains the EtherCAT identity with the revision number. Stored in it is the EtherCAT slave information, also colloquially known as ESI/XML configuration file for the EtherCAT master. See the corresponding chapter in the EtherCAT system manual (Link) for the relationships.

The eBIC is also stored in the ESI-EEPROM. The eBIC was introduced into the Beckhoff I/O production (terminals, box modules) from 2020; widespread implementation is expected in 2021.

The user can electronically access the eBIC (if existent) as follows:

- With all EtherCAT devices, the EtherCAT master (TwinCAT) can read the eBIC from the ESI-EEPROM
  - From TwinCAT 3.1 build 4024.11, the eBIC can be displayed in the online view.
  - To do this,

check the checkbox "Show Beckhoff Identification Code (BIC)" under EtherCAT  $\rightarrow$  Advanced Settings  $\rightarrow$  Diagnostics:

TwinCAT Project30 🕫 🗙										
General	Adapter	EtherCAT Online	CoE - C	Inline			0

-7	1007	Tem 7 (EK1110)	OP	0	1	8	2012 KW25 Mo						

- Note: as can be seen in the illustration, the production data HW version, FW version and production date, which have been programmed since 2012, can also be displayed with "Show Production Info".
- Access from the PLC: From TwinCAT 3.1. build 4024.24 the functions *FB\_EcReadBIC* and *FB\_EcReadBTN* are available in the Tc2\_EtherCAT Library from v3.3.19.0 for reading into the PLC..
- In the case of EtherCAT devices with CoE directory, the object 0x10E2:01 can additionally by used to display the device's own eBIC; the PLC can also simply access the information here:

• The device must be in PREOP/SAFEOP/OP for access:

Index	Name	Flags	Value		
1000	Device type	RO	0x015E1389 (22942601)		
1008	Device name	RO	ELM3704-0000		
1009	Hardware version	RO	00		
100A	Software version	RO	01		
100B	Bootloader version	RO	J0.1.27.0		
+ 1011:0	Restore default parameters	RO	>1<		
• 1018:0	Identity	RO	>4<		
= 10E2:0	Manufacturer-specific Identification C	RO	>1<		
10E2:01	SubIndex 001	RO	1P158442SBTN0008jekp1KELM3704	Q1	2P482001000016
+ 10F0:0	Backup parameter handling	RO	>1<		
+ 10F3:0	Diagnosis History	RO	>21 <		
10F8	Actual Time Stamp	RO	0x170bfb277e		

- The object 0x10E2 will be introduced into stock products in the course of a necessary firmware revision.
- From TwinCAT 3.1. build 4024.24 the functions *FB\_EcCoEReadBIC* and *FB\_EcCoEReadBTN* are available in the Tc2\_EtherCAT Library from v3.3.19.0 for reading into the PLC.
- For processing the BIC/BTN data in the PLC, the following auxiliary functions are available in *Tc2\_Utilities* from TwinCAT 3.1 build 4024.24 onwards
  - F\_SplitBIC: The function splits the Beckhoff Identification Code (BIC) sBICValue into its components based on known identifiers and returns the recognized partial strings in a structure ST\_SplitBIC as return value.
  - BIC\_TO\_BTN: The function extracts the BTN from the BIC and returns it as a value.
- Note: in the case of electronic further processing, the BTN is to be handled as a string(8); the identifier "SBTN" is not part of the BTN.
- · Technical background

The new BIC information is additionally written as a category in the ESI-EEPROM during the device production. The structure of the ESI content is largely dictated by the ETG specifications, therefore the additional vendor-specific content is stored with the help of a category according to ETG.2010. ID 03 indicates to all EtherCAT masters that they must not overwrite these data in case of an update or restore the data after an ESI update.

The structure follows the content of the BIC, see there. This results in a memory requirement of approx. 50..200 bytes in the EEPROM.

- Special cases
  - If multiple, hierarchically arranged ESCs are installed in a device, only the top-level ESC carries the eBIC Information.
  - If multiple, non-hierarchically arranged ESCs are installed in a device, all ESCs carry the eBIC Information.
  - If the device consists of several sub-devices with their own identity, but only the top-level device is accessible via EtherCAT, the eBIC of the top-level device is located in the CoE object directory 0x10E2:01 and the eBICs of the sub-devices follow in 0x10E2:nn.

#### PROFIBUS, PROFINET, DeviceNet devices etc.

Currently, no electronic storage and readout is planned for these devices.

## 2 Product overview

### 2.1 Introduction

Fig. 4: EL6752

#### Master and slave terminals for DeviceNet

The master and slave terminals for DeviceNet correspond to the FC5201 PCI card from Beckhoff. Thanks to the connection via EtherCAT, no PCI slots are required in the PC. Within an EtherCAT terminal network, the terminal enables the integration of any DeviceNet devices.

The EL6752 is optionally available in a master or slave version and has a powerful protocol implementation with many features:

- All I/O modes of the DeviceNet are supported: polling, change of state, cyclic, strobed
- Unconnected message manager (UCMM)
- Powerful parameter and diagnostics interfaces
- Error management freely configurable for each bus device

A description of all functionalities and operating modes can be found in the chapter "Configuration [ $\blacktriangleright$  70]" and the corresponding subsections.

## 2.2 Technical data

Technical data	EL6752-0000 EL6752-0010						
Bus system	DeviceNet						
Variante	Master	Slave					
Number of fieldbus channels	1						
Data transfer rate	125, 250 or 500 kbaud						
Bus interface	Open style 5-pin connector according to DeviceNet specification, galvanically isolated; card comes with connector.						
Bus devices	maximum 63 slaves						
Communication	DeviceNet network master (scanner)	DeviceNet - slave					
Diagnostics	Status LEDs						
Power supply	via the E-bus						
Current consumption via E-bus	typ. 260 mA						
Electrical isolation	500 V (E-bus/CANopen)						
Configuration	with TwinCAT System Manager						
Weight	approx. 70 g						
Permissible ambient temperature	-25 °C +60 °C (extended temperature range)						
range during operation	0 °C +55 °C (according to <u>cULus</u> [▶ <u>21]</u> for Canada and the USA) 0 °C +55 °C (according to ATEX, see special conditions)						
Permissible ambient temperature range during storage	ermissible ambient temperature -40 °C +85 °C ange during storage						
Permissible relative humidity	95 %, no condensation						
Dimensions (W x H x D)	approx. 26 mm x 100 mm x 52 mm						
Mounting [ 22]	on 35 mm mounting rail conforms to EN 60715						
Vibration / shock resistance	conforms to EN 60068-2-6 / EN 60068-2-27						
EMC immunity / emission	C immunity / emission conforms to EN 61000-6-2 / EN 61000-6-4						
Protection class IP20							
Installation position	variable						
Approvals / Markings*	CE, <u>cULus [▶ 21]</u> , UKCA, EAC,						
	ATEX [] 18], IECEX [] 19]						

\*) Real applicable approvals/markings see type plate on the side (product marking).

IECEx	Ex nA IIC T4 Gc

## 3 Basic DeviceNet principles

#### Introduction to the system

DeviceNet is an open system based on CAN. CAN was developed some years ago by R. Bosch for data transmission in motor vehicles. Millions of CAN chips are now in use. A disadvantage for application in automation is that CAN does not contain definitions for the application layer. CAN only defines the physical and data link layer.

DeviceNet specifies a uniform application layer and this makes it possible to use the CAN protocol for industrial applications. ODVA (the Open DeviceNet Vendor Association) is an independent association which supports manufacturers and users of the DeviceNet system. ODVA ensures that all devices which conform to the specification can operate together in one system, regardless of their manufacturer. CAN's bit arbitration procedure makes it theoretically possible to operate communication networks using master/slave and multimaster access methods.

Further details can be found on the official website of the ODVA (http://www.odva.org).

Fig. 5: Example of DeviceNet in use

#### Bus cable

The bus cable consists of two pairs of shielded twisted-pair wiring, one for the data transfer and one for the power supply. The latter can carry currents of up to 8 amperes. The maximum possible length of a line depends essentially on the baud rate. If you choose the highest Baud rate (500 kbaud) you are restricted to lines of at most 100 m. With the lowest Baud rate (125 kbaud) you will be able to use cable with an overall length of 500 m. Refer to the chapter "Mounting and wiring [▶ 26]" for details

Fig. 6: Example of DeviceNet cabling

## 4 Mounting and cabling

### 4.1 Instructions for ESD protection

#### NOTICE

#### Destruction of the devices by electrostatic discharge possible!

The devices contain components at risk from electrostatic discharge caused by improper handling.

- Please ensure you are electrostatically discharged and avoid touching the contacts of the device directly.
- Avoid contact with highly insulating materials (synthetic fibers, plastic film etc.).
- Surroundings (working place, packaging and personnel) should by grounded probably, when handling with the devices.
- Each assembly must be terminated at the right hand end with an <u>EL9011</u> or <u>EL9012</u> bus end cap, to ensure the protection class and ESD protection.

Fig. 7: Spring contacts of the Beckhoff I/O components

### 4.2 Explosion protection

### 4.2.1 ATEX - Special conditions (extended temperature range)

#### **WARNING**

Observe the special conditions for the intended use of Beckhoff fieldbus components with extended temperature range (ET) in potentially explosive areas (directive 2014/34/EU)!

- The certified components are to be installed in a suitable housing that guarantees a protection class of at least IP54 in accordance with EN 60079-15! The environmental conditions during use are thereby to be taken into account!
- For dust (only the fieldbus components of certificate no. KEMA 10ATEX0075 X Issue 9): The equipment shall be installed in a suitable enclosure providing a degree of protection of IP54 according to EN 60079-31 for group IIIA or IIIB and IP6X for group IIIC, taking into account the environmental conditions under which the equipment is used!
- If the temperatures during rated operation are higher than 70°C at the feed-in points of cables, lines or pipes, or higher than 80°C at the wire branching points, then cables must be selected whose temperature data correspond to the actual measured temperature values!
- Observe the permissible ambient temperature range of -25 to 60°C for the use of Beckhoff fieldbus components with extended temperature range (ET) in potentially explosive areas!
- Measures must be taken to protect against the rated operating voltage being exceeded by more than 40% due to short-term interference voltages!
- The individual terminals may only be unplugged or removed from the Bus Terminal system if the supply voltage has been switched off or if a non-explosive atmosphere is ensured!
- The connections of the certified components may only be connected or disconnected if the supply voltage has been switched off or if a non-explosive atmosphere is ensured!
- The fuses of the KL92xx/EL92xx power feed terminals may only be exchanged if the supply voltage has been switched off or if a non-explosive atmosphere is ensured!
- Address selectors and ID switches may only be adjusted if the supply voltage has been switched off or if a non-explosive atmosphere is ensured!

#### Standards

The fundamental health and safety requirements are fulfilled by compliance with the following standards:

- EN 60079-0:2012+A11:2013
- EN 60079-15:2010
- EN 60079-31:2013 (only for certificate no. KEMA 10ATEX0075 X Issue 9)

#### Marking

The Beckhoff fieldbus components with extended temperature range (ET) certified according to the ATEX directive for potentially explosive areas bear the following marking:

#### II 3G KEMA 10ATEX0075 X Ex nA IIC T4 Gc Ta: -25 ... +60°C

II 3D KEMA 10ATEX0075 X Ex tc IIIC T135°C Dc Ta: -25 ... +60°C (only for fieldbus components of certificate no. KEMA 10ATEX0075 X Issue 9)

or

#### II 3G KEMA 10ATEX0075 X Ex nA nC IIC T4 Gc Ta: -25 ... +60°C

II 3D KEMA 10ATEX0075 X Ex tc IIIC T135°C Dc Ta: -25 ... +60°C (only for fieldbus components of certificate no. KEMA 10ATEX0075 X Issue 9)

### 4.2.2 IECEx - Special conditions

#### **▲ WARNING**

# Observe the special conditions for the intended use of Beckhoff fieldbus components in potentially explosive areas!

- For gas: The equipment shall be installed in a suitable enclosure providing a degree of protection of IP54 according to IEC 60079-15, taking into account the environmental conditions under which the equipment is used!
- For dust (only the fieldbus components of certificate no. IECEx DEK 16.0078X Issue 3): The equipment shall be installed in a suitable enclosure providing a degree of protection of IP54 according to EN 60079-31 for group IIIA or IIIB and IP6X for group IIIC, taking into account the environmental conditions under which the equipment is used!
- The equipment shall only be used in an area of at least pollution degree 2, as defined in IEC 60664-1!
- Provisions shall be made to prevent the rated voltage from being exceeded by transient disturbances of more than 119 V!
- If the temperatures during rated operation are higher than 70°C at the feed-in points of cables, lines or pipes, or higher than 80°C at the wire branching points, then cables must be selected whose temperature data correspond to the actual measured temperature values!
- Observe the permissible ambient temperature range for the use of Beckhoff fieldbus components in potentially explosive areas!
- The individual terminals may only be unplugged or removed from the Bus Terminal system if the supply voltage has been switched off or if a non-explosive atmosphere is ensured!
- The connections of the certified components may only be connected or disconnected if the supply voltage has been switched off or if a non-explosive atmosphere is ensured!
- Address selectors and ID switches may only be adjusted if the supply voltage has been switched off or if a non-explosive atmosphere is ensured!
- The front hatch of certified units may only be opened if the supply voltage has been switched off or a non-explosive atmosphere is ensured!

#### Standards

The fundamental health and safety requirements are fulfilled by compliance with the following standards:

- EN 60079-0:2011
- EN 60079-15:2010
- EN 60079-31:2013 (only for certificate no. IECEx DEK 16.0078X Issue 3)

#### Marking

Beckhoff fieldbus components that are certified in accordance with IECEx for use in areas subject to an explosion hazard bear the following markings:

IECEx DEK 16.0078 X		
Ex nA IIC T4 Gc		
Ex tc IIIC T135°C Dc		
IECEx DEK 16.0078 X Ex nA IIC T4 Gc		

### 4.2.3 Continuative documentation for ATEX and IECEx

## BECKHOFF

## 4.3 UL notice

#### Application

Examination

Beckhoff EtherCAT modules are intended for use with Beckhoff's UL Listed EtherCAT System only.

#### 

# For cULus examination, the Beckhoff I/O System has only been investigated for risk of fire and electrical shock (in accordance with UL508 and CSA C22.2 No. 142).

#### ▲ CAUTION For devices with Ethernet connectors

Not for connection to telecommunication circuits.

#### **Basic principles**

UL certification according to UL508. Devices with this kind of certification are marked by this sign:

## 4.4 Mounting and demounting - traction lever unlocking

The terminal modules are fastened to the assembly surface with the aid of a 35 mm mounting rail (e. g. mounting rail TH 35-15).

#### Fixing of mounting rails

The locking mechanism of the terminals and couplers extends to the profile of the mounting rail. At the installation, the locking mechanism of the components must not come into conflict with the fixing bolts of the mounting rail. To mount the recommended mounting rails under the terminals and couplers, you should use flat mounting connections (e.g. countersunk screws or blind rivets).

#### **▲ WARNING**

#### Risk of electric shock and damage of device!

Bring the bus terminal system into a safe, powered down state before starting installation, disassembly or wiring of the Bus Terminals!

#### Mounting

• Fit the mounting rail to the planned assembly location.

and press (1) the terminal module against the mounting rail until it latches in place on the mounting rail (2).

· Attach the cables.

#### Demounting

- Remove all the cables. Thanks to the KM/EM connector, it is not necessary to remove all the cables separately for this, but for each KM/EM connector simply undo 2 screws so that you can pull them off (fixed wiring)!
- Lever the unlatching hook on the left-hand side of the terminal module upwards with a screwdriver (3). As you do this
  - an internal mechanism pulls the two latching lugs (3a) from the top hat rail back into the terminal module,
  - the unlatching hook moves forwards (3b) and engages

- In the case 32 and 64 channel terminal modules (KMxxx4 and KMxxx8 or EMxxx4 and EMxxx8) you now lever the second unlatching hook on the right-hand side of the terminal module upwards in the same way.
- Pull (4) the terminal module away from the mounting surface.

## 4.5 Mounting and demounting - top front unlocking

The terminal modules are fastened to the assembly surface with the aid of a 35 mm mounting rail (e. g. mounting rail TH 35-15).

#### Fixing of mounting rails

The locking mechanism of the terminals and couplers extends to the profile of the mounting rail. At the installation, the locking mechanism of the components must not come into conflict with the fixing bolts of the mounting rail. To mount the recommended mounting rails under the terminals and couplers, you should use flat mounting connections (e.g. countersunk screws or blind rivets).

#### **▲ WARNING**

#### Risk of electric shock and damage of device!

Bring the bus terminal system into a safe, powered down state before starting installation, disassembly or wiring of the Bus Terminals!

#### Mounting

• Fit the mounting rail to the planned assembly location.

and press (1) the terminal module against the mounting rail until it latches in place on the mounting rail (2).

• Attach the cables.

#### Demounting

- Remove all the cables.
- Lever the unlatching hook back with thumb and forefinger (3). An internal mechanism pulls the two latching lugs (3a) from the top hat rail back into the terminal module.

• Pull (4) the terminal module away from the mounting surface. Avoid canting of the module; you should stabilize the module with the other hand, if required.

### 4.6 Disposal

Products marked with a crossed-out wheeled bin shall not be discarded with the normal waste stream. The device is considered as waste electrical and electronic equipment. The national regulations for the disposal of waste electrical and electronic equipment must be observed.

### 4.7 DeviceNet wiring

### 4.7.1 CAN / DeviceNet topology

CAN/DeviceNet is a 2-wire bus system, to which all participating devices are connected in parallel (i.e. using short drop lines) (Fig. *DeviceNet Topology*). The bus must be terminated at each end with a 120 (or 121) Ohm terminating resistor to prevent reflections. This is also necessary even if the cable lengths are very short!

Fig. 8: DeviceNet topology

Since the CAN signals are represented on the bus as the difference between the two levels, the CAN leads are not very sensitive to incoming interference (EMI): Both leads are affected, so the interference has very little effect on the difference.

Fig. 9: Low interference through difference levels

### 4.7.2 Bus length

The maximum length of a CAN bus is primarily limited by the signal propagation delay. The multi-master bus access procedure (arbitration) requires signals to reach all the nodes at effectively the same time (before the sampling within a bit period). Since the signal propagation delays in the CAN connecting equipment (transceivers, opto-couplers, CAN controllers) are almost constant, the line length must be chosen in accordance with the baud rate:

Baud rate	Bus length
500 kbit/s	< 100 m
250 kbit/s	< 250 m
125 kbit/s	< 500 m

### 4.7.3 Drop lines

Drop lines must always be avoided as far as possible, since they inevitably cause reflections. The reflections caused by drop lines are not however usually critical, provided they have decayed fully before the sampling time. In the case of the bit timing settings selected in the Bus Couplers it can be assumed that this is the case, provided the following drop line lengths are not exceeded:

## BECKHOFF

Baud rate	Drop line length Total length of all drop lines		
500 kbit/s	< 6 m	< 39 m	
250 kbit/s	< 6 m	< 78 m	
125 kbit/s	< 6 m	< 156 m	

Drop lines must not be furnished with termination resistors (Fig. Drop line topology).

Fig. 10: Drop line topology

### 4.7.4 Star Hub (Multiport Tap)

Shorter drop line lengths must be maintained when passive distributors ("multiport taps"), such as the Beckhoff ZS5052-4500 Distributor Box. The following table indicates the maximum drop line lengths and the maximum length of the trunk line (without the drop lines):

#### Guide values

The following values are recommended by BECKHOFF.

Baud rate	Drop line length with multiport topology	Trunk line length (without drop lines)			
500 kbit/s	< 1.2 m	< 66 m			
250 kbit/s	< 2.4 m	< 120 m			
125 kbit/s	< 4.8 m	< 310 m			

### 4.7.5 CAN cable

Screened twisted-pair cables (2x2) with a characteristic impedance of between 108 and 132 Ohm is recommended for the CAN wiring. If the CAN transceiver's reference potential (CAN ground) is not to be connected, the second pair of conductors can be omitted. (This is only recommended for networks of small physical size with a common power supply for all the participating devices).

#### ZB5200 CAN/DeviceNet Cable

The ZB5200 cable material corresponds to the DeviceNet specification, and is also suitable for CANopen systems. The ready-made ZK1052-xxxx-xxxx bus cables for the Fieldbus Box modules are made from this cable material. It has the following specification:

- 2 x 2 x 0.34 mm<sup>2</sup> (AWG 22) twisted pairs
- double screened braided screen with filler strand
- characteristic impedance (1 MHz): 126 ohm
- Conductor resistance 54 Ohm/km
- sheath: grey PVC, outside diameter 7.3 mm
- printed with "InterlinkBT DeviceNet Type 572" as well as UL and CSA ratings
- · stranded wire colours correspond to the DeviceNet specification
- UL recognized AWM Type 2476 rating
- CSA AWM I/II A/B 80°C 300V FT1
- corresponds to the DeviceNet "Thin Cable" specification

Fig. 11: DeviceNet cable configuration

### 4.7.6 Shielding

The screen is to be connected over the entire length of the bus cable, and only galvanically grounded at one point, in order to avoid ground loops.

The design of the screening, in which HF interference is diverted through R/C elements to the mounting rail assumes that the rail is appropriately earthed and free from interference. If this is not the case, it is possible that HF interference will be transmitted from the mounting rail to the screen of the bus cable. In that case the screen should not be attached to the couplers - it should nevertheless still be fully connected through.

## **BECKHOFF**

## 7 Cable colours and pin assignment

Fig. 12: Pin assignment (top view EL6752)

Suggested method of using the Beckhoff CAN cable on Bus Terminal and Fieldbus Box:

Pin	EL6752 assignment ZB5200 cable color			
1	V+ (24 V)	red		
2	CAN High	white		
3	Shield	Filler strand		
4	CAN Low	blue		
5	V-	black		

### 4.8 Installation positions

#### NOTICE

#### Constraints regarding installation position and operating temperature range

Please refer to the technical data for a terminal to ascertain whether any restrictions regarding the installation position and/or the operating temperature range have been specified. When installing high power dissipation terminals ensure that an adequate spacing is maintained between other components above and below the terminal in order to guarantee adequate ventilation!

#### **Optimum installation position (standard)**

The optimum installation position requires the mounting rail to be installed horizontally and the connection surfaces of the EL/KL terminals to face forward (see Fig. *Recommended distances for standard installation position*). The terminals are ventilated from below, which enables optimum cooling of the electronics through convection. "From below" is relative to the acceleration of gravity.

Fig. 13: Recommended distances for standard installation position

Compliance with the distances shown in Fig. *Recommended distances for standard installation position* is recommended.

#### Other installation positions

All other installation positions are characterized by different spatial arrangement of the mounting rail - see Fig Other installation positions.

The minimum distances to ambient specified above also apply to these installation positions.

## **BECKHOFF**

Fig. 14: Other installation positions

## 4.9 **Positioning of passive Terminals**

#### Hint for positioning of passive terminals in the bus terminal block

EtherCAT Terminals (ELxxxx / ESxxxx), which do not take an active part in data transfer within the bus terminal block are so called passive terminals. The passive terminals have no current consumption out of the E-Bus.

To ensure an optimal data transfer, you must not directly string together more than two passive terminals!

Examples for positioning of passive terminals (highlighted)

Fig. 15: Correct positioning

Fig. 16: Incorrect positioning

## 5 DeviceNet communication

## 5.1 DeviceNet Introduction

# De√iceNet.

Fig. 17: DeviceNet

DeviceNet is an open system based on CAN. CAN was developed some years ago by R. Bosch for data transmission in motor vehicles. Millions of CAN chips are now in use. A disadvantage for application in automation is that CAN does not contain definitions for the application layer. CAN only defines the physical and data link layer.

DeviceNet specifies a uniform application layer and this makes it possible to use the CAN protocol for industrial applications. ODVA (the Open DeviceNet Vendor Association) is an independent association which supports manufacturers and users of the DeviceNet system. ODVA ensures that all devices which conform to the specification can operate together in one system, regardless of their manufacturer.

Fig. 18: Example of DeviceNet in use

DeviceNet is a sensor/actuator bus system. It is internationally standardised (EN50325) and is based on CAN (Controller Area Network). DeviceNet supports a number of communication types for the input and output data:

- Polling: The master module ("scanner") sends the output data cyclically to the assigned devices and receives the input data in an answer telegram.
- Change-of-State: Telegrams are sent as soon as their contents have changed.
- Cyclic: The modules send the data automatically after a cycle time has elapsed.
- Strobed: The scanner requests the input data using a broadcast telegram to all the devices.

The DeviceNet devices support all I/O communication types.

The DeviceNet devices are parameterized via acyclical services (explicit messaging).

The effective utilization of the bus bandwidth allows DeviceNet, particularly in Change-of-State mode, to achieve short system reaction times in spite of the relatively low data rates. The BECKHOFF DeviceNet devices have a powerful implementation of the protocol. Through active participation in the ODVA's technical committees, BECKHOFF are contributing to the further development of this bus system, and has in this way itself gathered profound DeviceNet expertise.

#### Configuration

The node address is set in the range from 0 to 63 using two decimally coded rotary switches. The data transfer rate set at the DeviceNet scanner is automatically recognized by the DeviceNet Box (auto baud rate). "Electronic Data Sheets" (EDS files) for DeviceNet configuration tools are available for download from the Beckhoff internet site (<u>http://www.beckhoff.de</u>), and on the BECKHOFF product CDs. Special I/O parameters that are not covered by the DeviceNet standard can be set via the KS2000 software (serial connection) or via acyclical explicit messages.

#### Diagnostics

The extensive diagnostic functions of the BECKHOFF DeviceNet devices allow rapid fault localisation. The diagnostic messages are transmitted over the bus and collated by the master. The status of the network connection, the device status, the status of the inputs and outputs and of the power supply are displayed by LEDs.

#### Data transfer rates

Three data transfer rates from 125 kbaud to 500 kbaud are available for different bus lengths. The effective utilization of the bus bandwidth allows DeviceNet to achieve short system reaction times at relatively low data rates.

#### Topology

DeviceNet is based on a linear topology. The number of devices participating in each network is logically limited by DeviceNet to 64, but physically the present generation of drivers allows up to 64 nodes in one network segment. The maximum possible size of the network for any particular data rate is limited by the signal propagation delay required on the bus medium. For 500 kbaud, for instance, the network may extend 100 m, whereas at 125 kbaud the network may reach up to 500 m. At low data rates the size of the network can be increased by repeaters, which also allow the construction of tree structures.

#### Bus access procedures

CAN utilizes the Carrier Sense Multiple Access (CSMA) procedure, i.e. all participating devices have the same right of access to the bus and may access it as soon as it is free (multi-master bus access). The exchange of messages is thus not device-oriented but message-oriented. This means that every message is unambiguously marked with a prioritized identifier. In order to avoid collisions on the bus when messages are sent by different devices, a bit-wise bus arbitration is carried out at the start of the data transmission. The bus arbitration assigns bus bandwidth to the messages in the sequence of their priority. At the end of the arbitration phase only one bus device occupies the bus, collisions are avoided and the bandwidth is optimally exploited.

#### Configuration and parameterization

The TwinCAT System Manager allows all the DeviceNet parameters to be set conveniently. An "eds" file (electronic data sheet) is available on the BECKHOFF website (<u>http://www.beckhoff.de</u>) for the parameterization of BECKHOFF DeviceNet devices using configuration tools from other manufacturers.

### 5.2 Explicit messages

Program example "ExplMessageEditor": Https://infosys.beckhoff.com/content/1033/el6752/Resources/5979571979/.zip

With the following ADS commands you can use EL6752 to send explicit messages.

```
GET_ATTRIBUTE_SINGLE via ADSRead Data Transfer
SET_ATTRIBUTE_SINGLE via ADSWrite Data Transfer
COMMON_SERVICE via ADSReadWrite Data Transfer
```

For the ADS NetID and the port, the values from the system manager are to be used.

```
(*
GET ATTRIBUTE SINGLE via ADSRead Data Transfer
IDXGRP: Index GroupNumber = Object Class
IDXOFFS: Index OffsetNumber = (Object Instance *. 0x100) + Attribute Id
LEN: Read Data Lengths in Bytes
DESTADDR: Address of DataBuffer to read with the Get-Attribute Single Service
*)
fbADSRead(
NETID:= ADSNetId,
PORT:= ADSPort,
IDXGRP:= IGrp ADSRead,
IDXOFFS:= IOff_ADSRead,
LEN:= ADSReadLen,
DESTADDR:= ADR(GetAttributeData[0]),
READ:= ADSReadCommand,
TMOUT:= T#5s,
BUSY=> ADSReadBusy,
ERR=> ADSReadErr,
ERRID=> ADSReadErrID);
(*
COMMON SERVICE via ADSReadWrite Data Transfer
IDXGRP: Index GroupNumber = Object Class
IDXOFFS: Index OffsetNumber = (Object Instance *. 0x100) + Service Id
WRITELEN: Write Data Lengths in Bytes
READLEN: Read Data Lengths in Bytes
SRCADDR: Address of DataBuffer to write
DESTADDR: Address of DataBuffer to read
*)
fbADSReadWrite(
NETID:= ADSNetId,
PORT:= ADSPort,
IDXGRP:= Grp ADSReadWrite,
IDXOFFS:= IOff ADSReadWrite,
WRITELEN:= ADSReadWriteWriteLen,
READLEN:= ADSReadWriteReadLen,
SRCADDR:= ADR(CommonServiceWriteData[0]),
DESTADDR:= ADR(CommonServiceReadData[0]),
WRTRD:= ADSReadWriteCommand,
TMOUT:= T#5s,
BUSY=> ADSReadWriteBusy,
ERR=> ADSReadWriteErr,
ERRID=> ADSReadWriteErrID);
and
(*
SET ATTRIBUTE SINGLE via ADSWrite Data Transfer
IDXGRP: Index GroupNumber = Object Class
IDXOFFS: Index OffsetNumber = (Object Instance *. 0x100) + Attribute Id
LEN: Write Data Lengths in Bytes
SRCADDR: Address of DataBuffer to write with the Set-Attribute Single Service
*)
fbADSWrite(
NETID:= ADSNetId,
```

```
PORT:= ADSPort,
IDXGRP:= IGrp_ADSWrite,
```

## BECKHOFF

IDXOFFS:= IOff\_ADSWrite, LEN:= ADSWriteLen, SRCADDR:= ADR(SetAttributeWriteData[0]), WRITE:= ADSWriteCommand, TMOUT:= T#5s, BUSY=> ADSWriteBusy, ERR=> ADSWriteErr, ERRID=> ADSWriteErrID);

Fig. 19: Using ADS NetID and Port from System Manager
# 6 Parameterization and commissioning

# 6.1 CoE Interface

# General description

The CoE interface (CAN application protocol over EtherCAT)) is used for parameter management of EtherCAT devices. EtherCAT slaves or the EtherCAT master manage fixed (read only) or variable parameters which they require for operation, diagnostics or commissioning.

CoE parameters are arranged in a table hierarchy. In principle, the user has read access via the fieldbus. The EtherCAT master (TwinCAT System Manager) can access the local CoE lists of the slaves via EtherCAT in read or write mode, depending on the attributes.

Different CoE parameter types are possible, including string (text), integer numbers, Boolean values or larger byte fields. They can be used to describe a wide range of features. Examples of such parameters include manufacturer ID, serial number, process data settings, device name, calibration values for analog measurement or passwords.

The order is specified in two levels via hexadecimal numbering: (main)index, followed by subindex. The value ranges are

- Index: 0x0000 ...0xFFFF (0...65535<sub>dec</sub>)
- SubIndex: 0x00...0xFF (0...255<sub>dec</sub>)

A parameter localized in this way is normally written as 0x8010:07, with preceding "0x" to identify the hexadecimal numerical range and a colon between index and subindex.

The relevant ranges for EtherCAT fieldbus users are:

- 0x1000: This is where fixed identity information for the device is stored, including name, manufacturer, serial number etc., plus information about the current and available process data configurations.
- 0x8000: This is where the operational and functional parameters for all channels are stored, such as filter settings or output frequency.

Other important ranges are:

- 0x4000: here are the channel parameters for some EtherCAT devices. Historically, this was the first parameter area before the 0x8000 area was introduced. EtherCAT devices that were previously equipped with parameters in 0x4000 and changed to 0x8000 support both ranges for compatibility reasons and mirror internally.
- 0x6000: Input PDOs ("input" from the perspective of the EtherCAT master)
- 0x7000: Output PDOs ("output" from the perspective of the EtherCAT master)

# Availability

Not every EtherCAT device must have a CoE list. Simple I/O modules without dedicated processor usually have no variable parameters and therefore no CoE list.

If a device has a CoE list, it is shown in the TwinCAT System Manager as a separate tab with a listing of the elements:

Fig. 20: "CoE Online" tab

The figure above shows the CoE objects available in device "EL2502", ranging from 0x1000 to 0x1600. The subindices for 0x1018 are expanded.

# NOTICE

# Changes in the CoE directory (CAN over EtherCAT), program access

When using/manipulating the CoE parameters observe the general CoE notes in chapter "<u>CoE interface</u>" of the EtherCAT system documentation:

- Keep a startup list if components have to be replaced,
- Distinction between online/offline dictionary,
- Existence of current XML description (download from the Beckhoff website),
- "CoE-Reload" for resetting the changes
- Program access during operation via PLC (see <u>TwinCAT3 | PLC Library: Tc2 EtherCAT</u> and <u>Example</u> program R/W CoE)

# Data management and function "NoCoeStorage"

Some parameters, particularly the setting parameters of the slave, are configurable and writeable. This can be done in write or read mode

- via the System Manager (Fig. "CoE Online" tab) by clicking This is useful for commissioning of the system/slaves. Click on the row of the index to be parameterized and enter a value in the "SetValue" dialog.
- from the control system/PLC via ADS, e.g. through blocks from the TcEtherCAT.lib library This is recommended for modifications while the system is running or if no System Manager or operating staff are available.

# Data management

If slave CoE parameters are modified online, Beckhoff devices store any changes in a fail-safe manner in the EEPROM, i.e. the modified CoE parameters are still available after a restart. The situation may be different with other manufacturers.

An EEPROM is subject to a limited lifetime with respect to write operations. From typically 100,000 write operations onwards it can no longer be guaranteed that new (changed) data are reliably saved or are still readable. This is irrelevant for normal commissioning. However, if CoE parameters are continuously changed via ADS at machine runtime, it is quite possible for the lifetime limit to be reached. Support for the NoCoeStorage function, which suppresses the saving of changed CoE values, depends on the firmware version.

Please refer to the technical data in this documentation as to whether this applies to the respective device.

- If the function is supported: the function is activated by entering the code word 0x12345678 once in CoE 0xF008 and remains active as long as the code word is not changed. After switching the device on it is then inactive. Changed CoE values are not saved in the EEPROM and can thus be changed any number of times.
- Function is not supported: continuous changing of CoE values is not permissible in view of the lifetime limit.

# Startup list

Changes in the local CoE list of the terminal are lost if the terminal is replaced. If a terminal is replaced with a new Beckhoff terminal, it will have the default settings. It is therefore advisable to link all changes in the CoE list of an EtherCAT slave with the Startup list of the slave, which is processed whenever the EtherCAT fieldbus is started. In this way a replacement EtherCAT slave can automatically be parameterized with the specifications of the user.

If EtherCAT slaves are used which are unable to store local CoE values permanently, the Startup list must be used.

# Recommended approach for manual modification of CoE parameters

- Make the required change in the System Manager The values are stored locally in the EtherCAT slave
- If the value is to be stored permanently, enter it in the Startup list. The order of the Startup entries is usually irrelevant.

Fig. 21: Startup list in the TwinCAT System Manager

The Startup list may already contain values that were configured by the System Manager based on the ESI specifications. Additional application-specific entries can be created.

# **Online/offline list**

While working with the TwinCAT System Manager, a distinction has to be made whether the EtherCAT device is "available", i.e. switched on and linked via EtherCAT and therefore **online**, or whether a configuration is created **offline** without connected slaves.

In both cases a CoE list as shown in Fig. "CoE online tab" is displayed. The connectivity is shown as offline/ online.

- · If the slave is offline
  - The offline list from the ESI file is displayed. In this case modifications are not meaningful or possible.
  - The configured status is shown under Identity.
  - No firmware or hardware version is displayed, since these are features of the physical device.
  - **Offline** is shown in red.

# Channel-based order

The CoE list is available in EtherCAT devices that usually feature several functionally equivalent channels. For example, a 4-channel analog 0...10 V input terminal also has four logical channels and therefore four identical sets of parameter data for the channels. In order to avoid having to list each channel in the documentation, the placeholder "n" tends to be used for the individual channel numbers.

In the CoE system 16 indices, each with 255 subindices, are generally sufficient for representing all channel parameters. The channel-based order is therefore arranged in  $16_{dec}/10_{hex}$  steps. The parameter range 0x8000 exemplifies this:

- Channel 0: parameter range 0x8000:00 ... 0x800F:255
- Channel 1: parameter range 0x8010:00 ... 0x801F:255
- Channel 2: parameter range 0x8020:00 ... 0x802F:255
- ...

This is generally written as 0x80n0.

Detailed information on the CoE interface can be found in the <u>EtherCAT system documentation</u> on the Beckhoff website.

# 6.2 General notes for setting the watchdog

The EtherCAT terminals are equipped with a safety device (watchdog) which, e. g. in the event of interrupted process data traffic, switches the outputs (if present) to a presettable state after a presettable time, depending on the device and setting, e. g. to FALSE (off) or an output value.

The EtherCAT slave controller (ESC) features two watchdogs:

- SM watchdog (default: 100 ms)
- PDI watchdog (default: 100 ms)

Their times are individually parameterized in TwinCAT as follows:

Advanced Settings		×
<ul> <li>General</li> <li>Behavior</li> <li>Timeout Settings</li> <li>FMMU / SM</li> <li>Init Commands</li> <li>Distributed Clock</li> <li>ESC Access</li> </ul>	Behavior Startup Checking Check Vendor Id Check Product Code Check Revision Number Check Serial Number	State Machine         ✓ Auto Restore States         ✓ Relnit after Communication Error         ✓ Log Communication Changes         Final State         OP       © SAFEOP in Config Mode         © SAFEOP       © INIT
	Process Data         □ Use LRD/LWR instead of LRW         ☑ Include WC State Bit(s)         General         □ No AutoInc - Use 2. Address         Watchdog         □ Set Multiplier (Reg. 400h):         □ Set PDI Watchdog (Reg. 410h):         ☑ Set SM Watchdog (Reg. 420ht):	Info Data         ✓ Include State         ☐ Include Ads Address         ☐ Include AoE NetId         ☐ Include Drive Channels         2498         1000       ✓         ms:       100.000         0K       Cancel

Fig. 24: eEtherCAT tab -> Advanced Settings -> Behavior -> Watchdog

Notes:

- the Multiplier Register 400h (hexadecimal, i. e. x0400) is valid for both watchdogs.
- each watchdog has its own timer setting 410h or 420h, which together with the Multiplier results in a resulting time.
- important: the Multiplier/Timer setting is only loaded into the slave at EtherCAT startup if the checkbox in front of it is activated.
- if it is not checked, nothing is downloaded and the setting located in the ESC remains unchanged.
- the downloaded values can be seen in the ESC registers x0400/0410/0420: ESC Access -> Memory

# SM watchdog (SyncManager Watchdog)

The SyncManager watchdog is reset with each successful EtherCAT process data communication with the terminal. If, for example, no EtherCAT process data communication with the terminal takes place for longer than the set and activated SM watchdog time due to a line interruption, the watchdog is triggered. The status of the terminal (usually OP) remains unaffected. The watchdog is only reset again by a successful EtherCAT process data access.

The SyncManager watchdog is therefore a monitoring for correct and timely process data communication with the ESC from the EtherCAT side.

The maximum possible watchdog time depends on the device. For example, for "simple" EtherCAT slaves (without firmware) with watchdog execution in the ESC it is usually up to 170 seconds. For complex EtherCAT slaves (with firmware) the SM watchdog function is usually parameterized via Reg. 400/420 but executed by the  $\mu$ C and can be significantly lower. In addition, the execution may then be subject to a certain time uncertainty. Since the TwinCAT dialog may allow inputs up to 65535, a test of the desired watchdog time is recommended.

#### PDI watchdog (Process Data Watchdog)

If there is no PDI communication with the EtherCAT slave controller (ESC) for longer than the set and activated PDI watchdog time, this watchdog is triggered.

PDI (Process Data Interface) is the internal interface of the ESC, e.g. to local processors in the EtherCAT slave. With the PDI watchdog this communication can be monitored for failure.

The PDI watchdog is therefore a monitoring for correct and timely process data communication with the ESC, but viewed from the application side.

#### Calculation

Watchdog time = [1/25 MHz \* (Watchdog multiplier + 2)] \* PDI/SM watchdog

Example: default setting Multiplier=2498, SM watchdog=1000 -> 100 ms

The value in Multiplier + 2 corresponds to the number of 40ns base ticks representing one watchdog tick.

# 

# Undefined state possible!

The function for switching off the SM watchdog via SM watchdog = 0 is only implemented in terminals from version -0016. In previous versions this operating mode should not be used.

# **▲ CAUTION**

## Damage of devices and undefined state possible!

If the SM watchdog is activated and a value of 0 is entered the watchdog switches off completely. This is the deactivation of the watchdog! Set outputs are NOT set in a safe state if the communication is interrupted.

# 6.3 EtherCAT State Machine

The state of the EtherCAT slave is controlled via the EtherCAT State Machine (ESM). Depending upon the state, different functions are accessible or executable in the EtherCAT slave. Specific commands must be sent by the EtherCAT master to the device in each state, particularly during the bootup of the slave.

A distinction is made between the following states:

- Init
- Pre-Operational
- · Safe-Operational and
- Operational
- Boot

The regular state of each EtherCAT slave after bootup is the OP state.

Fig. 25: States of the EtherCAT State Machine

# Init

After switch-on the EtherCAT slave in the *Init* state. No mailbox or process data communication is possible. The EtherCAT master initializes sync manager channels 0 and 1 for mailbox communication.

# Pre-Operational (Pre-Op)

During the transition between *Init* and *Pre-Op* the EtherCAT slave checks whether the mailbox was initialized correctly.

In *Pre-Op* state mailbox communication is possible, but not process data communication. The EtherCAT master initializes the sync manager channels for process data (from sync manager channel 2), the FMMU channels and, if the slave supports configurable mapping, PDO mapping or the sync manager PDO assignment. In this state the settings for the process data transfer and perhaps terminal-specific parameters that may differ from the default settings are also transferred.

# Safe-Operational (Safe-Op)

During transition between *Pre-Op* and *Safe-Op* the EtherCAT slave checks whether the sync manager channels for process data communication and, if required, the distributed clocks settings are correct. Before it acknowledges the change of state, the EtherCAT slave copies current input data into the associated DP-RAM areas of the EtherCAT slave controller (ECSC).

In *Safe-Op* state mailbox and process data communication is possible, although the slave keeps its outputs in a safe state, while the input data are updated cyclically.

# Outputs in SAFEOP state

The default set watchdog monitoring sets the outputs of the module in a safe state - depending on
the settings in SAFEOP and OP - e.g. in OFF state. If this is prevented by deactivation of the watchdog monitoring in the module, the outputs can be switched or set also in the SAFEOP state.

# **Operational (Op)**

Before the EtherCAT master switches the EtherCAT slave from *Safe-Op* to *Op* it must transfer valid output data.

In the *Op* state the slave copies the output data of the masters to its outputs. Process data and mailbox communication is possible.

# Boot

In the *Boot* state the slave firmware can be updated. The *Boot* state can only be reached via the *Init* state.

In the *Boot* state mailbox communication via the *file access over EtherCAT* (FoE) protocol is possible, but no other mailbox communication and no process data communication.

# 6.4 TwinCAT System Manager

The TwinCAT System Manager tool is used for the configuration of the EL6752 DeviceNet master/slave terminal. The System Manager provides a representation of the number of programs of the TwinCat PLC systems, the configuration of the axis control and of the connected I/O channels as a structure, and organizes the mapping of the data traffic.

# Fig. 26: TwinCAT System Manager logo

For applications without TwinCAT PLC or NC, the TwinCAT System Manager Tool configures the programming interfaces for a wide range of application programs:

- ActiveX control (ADS-OCX) for e.g. Visual Basic, Visual C++, Delphi, etc.
- DLL interface (ADS-DLL) for e.g. Visual C++ projects
- Script interface (ADS script DLL) for e.g. VBScript, JScript, etc.

# System Manager – Features

- Bit-wise association of server process images and I/O channels
- · Standard data formats such as arrays and structures
- User defined data formats
- Continuous variable linking
- Drag and Drop
- Import and export at all levels

# Configuration by means of the TwinCAT System Manager

The procedure and the configuration facilities in the System Manager are described below.

EL6752 DeviceNet master terminal [▶ 46] EL6752-0010 - DeviceNet slave terminal [▶ 49]

# EL6752 DeviceNet master terminal

# Append device

The terminal can be appended to the I/O configuration either using the "Device search" routine in the TwinCAT System Manager or by manually selecting the "DeviceNet Master EL6752, EtherCAT" from the possible DeviceNet devices (Fig. *Appending the device "DeviceNet slave EL6752, EtherCAT"*). A right-click brings up the following context menu for selection:

	Insert Device	
SYSTEM - Configuration NC - Configuration Cam - Configuration Cam - Configuration T/O	Type:          • ## Profibus DP             • ## Profibus DP           • # Profibus DP             • DeviceNet Master EL6752, EtherCAT           • # DeviceNet Master CX1500-M520, PC104             • DeviceNet Master CIF30-DNM, 8 kByte ISA           • DeviceNet Master CIF50-DNM, 8 kByte PC1             • DeviceNet Master CIF104-DNM, 8 kByte PC104           • DeviceNet Master CIF104-DNM, 8 kByte PC104             • DeviceNet Master CIF104P-DNM, 8 kByte PC104           • DeviceNet Master CIF104P-DNM, 8 kByte PC104             • DeviceNet Master CIF104P-DNM, 8 kByte PC104           • DeviceNet Master CIF104P-DNM, 8 kByte PC104              • DeviceNet Monitor FC52xx, PCI	Ok Cancel

		Add. N	etIds:							Add
										Delete

Fig. 34: "ADS" tab

The EL6752-0010 is an ADS device with its own net ID, which can be changed here. All ADS services (diagnostics, acyclic communication) associated with the EL6752-0010 device must address the card via this NetID. Additional ADS Net IDs can be entered for addressing subordinate ADS devices (e.g. an additional fieldbus card in the same PC) via the card.

#### "(Online) DPRAM" tab

Read access to the DPRAM of the card is provided for diagnostic purposes.

#### Box EL6752-0010 slave

A box "EL6752-0010 (DeviceNet slave)" is created automatically. Further parameters have to be set:

#### Box EL6752-0010 tab:

	General EL6752	2-0010 ADS EtherCAT	
<ul> <li>Image: Box 1 (EL6752-0010)</li> </ul>	Name: Type: Comment:	Device 3 (EL6752-0010) DeviceNet Slave EL6752, EtherCAT	ld: 3
			Y
		Disabled	Create symbols 📃

Fig. 35: "General" tab, Box EL6752-0010

#### DeviceNet IO modes

The EL6752-0010 supports the DeviceNet modes cyclic polling, change of state / cyclic and bit strobe. The IO modes can be selected according to the DeviceNet specification.

The DeviceNet IO	mode cvclic	polling is the	default selection	for the EL6752-0010:
	mode byone	poining io uno	dolddir Soloolion	

IO mode	Input data length / bytes	Output data length / bytes
Polling	0 - 255	0 - 255
Change of State	0 - 255	0 - 255
Cyclic	0 - 255	0 - 255
Bit strobe	1 bit	0-8

# Polling / Change of State (COS) / Cyclic

The cyclic polling mode is characterized by cyclic polling of the IO data by the master. The change of state mode is characterized by event-oriented sending of IO data. In cyclic mode the IO data are sent cyclically based on the communication parameters configured by the master. Since the communication settings are specified through the master no further settings are possible. Further information on the modes can be found in section DeviceNet Communication. The settings are identical for these modes.

The input and output data lengths are pre-initialized to 8 byte each:

Fig. 37: Adding further variables

The data length is converted to a byte stream according to the DeviceNet specification and displayed in the tab for the corresponding connection:

Fig. 38: "Connection" tab showing connection type "Polling" and input and output parameters

# Maximum output data length

The maximum data length per data direction is 255 bytes.

The indicated input and output data lengths must be configured for the corresponding DeviceNet master.

# **Bit strobe**

The IO mode bit strobe involves an 8-byte command from the master to the slaves. For each possible address/MAC ID (DeviceNet address space: 64) 1 bit of user data is allocated. The maximum length of the response message from the slave is 8 bytes. It is sent to the master immediately when the bit strobe command is received.

Fig. 39: Display of output parameters in the TwinCAT tree for connection type "Bit strobe"

1	

# Maximum output data length

The maximum output data length is 8 bytes. The input data length is fixed.

Since the communication settings are specified through the master no further settings are possible.

# 6.5 Beckhoff DeviceNet Bus Coupler

The Bus Coupler BK52xx and the IPxxx-B520 Fieldbus Box are used in the **DeviceNet** bus. The specific properties which distinguish them from other Bus Couplers and/or fieldbus box modules are then described below.

Types	Description
BK5210	Economy Bus Coupler
BK5220	Economy + Bus Coupler
LC5200	Low-Cost Bus Coupler
BK5250	Compact Bus Coupler
BC5250	Compact Bus Terminal Controller with 48 kbyte program memory
BX5200	BX Bus Terminal Controller with 256 kbyte program memory
IPxxxx-B520	Fieldbus compact box: DeviceNet input/output module in protection class IP67

The following tabs are used for parameterization:

- <u>"BK52x0" tab [</u> <u>56</u>]
- <u>"Startup Attributes" tab [</u>> <u>58</u>]
- <u>"ADS" tab [▶ 59]</u>
- <u>"Parameters" tab [</u> 60]
- <u>"Diag" tab [</u>▶ <u>60]</u>

# "BK52x0" tab

K-Bus Update: 1!	50 μs Firmware Update (via COMx)

Fig. 40: "BK52x0" tab

# MAC-ID

Sets the MAC ID, i.e. the device address of the DeviceNet device (between 0 and 63). This value must comply with the value set at the Bus Coupler and/or at the compact box.

## Cycle time

Sets the cycle time of the IO connection polling and bit strobe. The value is used as "Expected Packet Rate" attribute of the "Connection Object" according to the DeviceNet specification.

#### Electronic Key

Serves to check the devices within the network at the system StartUp. The electronic key is read from the devices at every system StartUp and compared with the saved configuration.

#### Polled

#### Produced/Consumed

Activation of the "Polling" mode, cyclic writing and reading of IO data. Setting of the data content of the data transmitted via the polled IO connections. You can choose from digital data, analog data or both. The selection depends upon the BK52xx terminal arrangement.

#### **Bit-Strobed**

#### **Produced/Consumed**

Activation of the "Bit Strobe" operating mode. A broadcast message requests all nodes to send their bit strobe message (up to 7 bytes input or status data). Setting of the data content of the data transmitted via the bit-strobed IO connections. You can choose between digital data or diagnostic data.

#### Change of State / Cyclic

#### Produced/Consumed

Setting of the data content of the data transmitted via the change of state/cyclical IO connections. You can choose from digital data, analog data or both. The selection depends upon the BK52xx terminal arrangement.

#### Change of State / Cyclic

Selection of the required operating mode.

#### Heartbeat-Rate / Send-Rate

In the "Change of State" mode the heartbeat rate gives the cycle time of the cyclical send of the lower-level (i.e. in addition to the event driven) IO data. In "Cyclic" mode the send rate specifies the cycle time with which the IO data are sent.

#### Inhibit-Time

Delay time in "Change of State" mode; after a change of state IO data are sent after the specified time at the earliest.

#### Acknowledge Timeout

Time before the retransmission in the event of faulty acknowledgement of a change of state / cyclical message.

#### Acknowldege Retry Limit

Maximum number of retransmissions until IO connection goes into error mode.

#### K-Bus update

Calculates the expected time required for a full update of the terminal bus (depends on the connected terminals).

#### Auto Device Replacement (ADR)

Not supported.

# "Startup Attributes" tab

#### Fig. 43: "ADS" tab

The node (Bus Coupler) is assigned an ADS port to enable writing and reading of DeviceNet objects at runtime (e.g. from the PLC). It can be changed if required. A detailed description of explicit messages can be found in section "DeviceNet Communication" under "Explicit Messages".

DeviceNet objects can be accessed via Online Access. To this end the DeviceNet-specific information such as Class/Instance/Attributes has to be entered.

#### Read

Reading of an object attribute via DeviceNet "Get\_Attribute\_Single" service. A service ID is not required.

# Write

Writing of an object attribute via DeviceNet "Set\_Attribute\_Single" service. A service ID is not required.

# **Read/Write**

Executing any DeviceNet service. Specification of the service ID is required.

# "Parameter" tab

Fig. 46: Adding a DeviceNet device (I/O Devices-> Device n (EL6752)->right-click-> Append Box...)

# 6.6.1 Integrating a DeviceNet device with EDS file

If an EDS file is available for the DeviceNet to be integrated, it must be copied into the **..TwinCAT/IO/ DeviceNet** directory.

Subsequently the device appears under the "Append Box" selection (see fig. Adding a DeviceNet device (I/O Devices -> Device n (EL6752) -> right-click -> Append Box ...) with the manufacturer ID:

Fig. 47: Adding a box with the manufacturer ID

Alternatively a DeviceNet device with EDS file can be integrated via the "Miscellaneous" option:

#### 😑 🎒 I/O Devices Mac-Id: 0 \$ Device 1 (EtherCAT) Device 2 (EL6752) nsert Box 📥 Device 2 (EL6752)-Image 🛓 🚯 Inputs Allen-Bradley Туре Ok Box 2 (BK5220) Allen-Bradley Company, Inc. <u>.</u> Box 10 (8K5250) AUTOMATIONDIRECT.COM Cancel ÷. 🖶 🌌 Box 8 (EL6752-0010) Beckholf Automation Smble 😥 🧱 Box 10 (DN Node) ? 🗙 Cutler-Hammer Produce Box 10 (DN Node) Festo Corporation 👷 Device 3 (EL6752-0010) . Fig. 48: Adding a box without EDS file

Depending on the information contained in the EDS file a DeviceNet node will appear with or without Parameters tab.

The IO mode and the corresponding data lengths are specified in the EDS file.

# 6.6.2 Integrating a DeviceNet device without EDS file

A DeviceNet device without EDS file can be integrated via the "Miscellaneous" option:

Fig. 49: Adding a box without EDS file (click "Cancel")

Terminate EDS file selection with "Cancel". A general DeviceNet device is created.

Selection of the IO mode and the general configuration must then be carried out manually.

RECKHOFF

# **DeviceNet IO modes**

For DeviceNet devices the EL6752 supports the DeviceNet modes cyclic polling, change of state / cyclic and bit strobe. The IO modes can be selected according to the DeviceNet specification.

The DeviceNet IO mode cyclic polling is the default selection for the EL6752:

IO mode	Input data length / bytes	Output data length / bytes
Polling	0 - 255	0 - 255
Change of State	0 - 255	0 - 255
Cyclic	0 - 255	0 - 255
Bit strobe	1 bit	0-8
Total of all IO data	max. xxx bytes	max. xxx bytes

# polling / change of state (COS) / cyclic

The cyclic polling mode is characterized by cyclic polling of the IO data by the master. The change of state mode is characterized by event-oriented sending of IO data. In cyclic mode the IO data are sent cyclically based on the communication parameters configured by the master. The settings are identical for these modes.

The input and output data lengths must be supplemented according to the device configuration:

Fig. 50: Supplementing the input and output data

Input or output data must be appended depending on the device configuration. Any data type can be selected:

Fig. 51: Add Variables

The data length is converted to a byte stream according to the DeviceNet specification and displayed in the tab for the corresponding connection:

Fig. 52: "Connection" tab showing connection type "Polling" and input and output parameters

# Maximum data length

The maximum data length per data direction is 255 bytes.

# Bit strobe

The IO mode bit strobe involves an 8-byte command from the master to the slaves. For each possible address/MAC ID (DeviceNet address space: 64) 1 bit of user data is allocated. The maximum length of the response message from the slave is 8 bytes. It is sent to the master immediately when the bit strobe command is received.

After selection of the bit strobe mode the input data must be configured accordingly. Any data type can be selected (see polling/ COS / cyclic). The data length is converted to a byte stream according to the DeviceNet specification and displayed in the tab for the bit strobe connection:

Fig. 53: "Connection" tab showing connection type "Bit Strobe" and input and output parameters

# Maximum data length

The maximum input data length is 8 bytes. The output data length is fixed.

Since the communication settings are specified through the master no further settings are possible.

# 6.6.3 Parameterization of a DeviceNet device

The DeviceNet devices are parameterized with the following tabs:

- <u>"DeviceNet Node" tab [</u>) 66]
- <u>"Startup Attributes" tab [▶ 67]</u>
- <u>"ADS" tab [▶ 68]</u>
- <u>"Parameter" tab [▶ 69]</u>
- <u>"Diag" tab [▶ 69]</u>

Fig. 54: "DeviceNet Node" tab

# MAC-ID

Sets the MAC ID, i.e. the device address of the DeviceNet device (between 0 and 63). This value must comply with the value set at the Bus Coupler and/or at the compact box.

#### Cycle time

Sets the cycle time of the IO connection polling and bit strobe. The value is used as "Expected Packet Rate" attribute of the "Connection Objects" according to the DeviceNet specification.

# **Electronic Key**

Serves to check the devices within the network at the system StartUp. The electronic key is read from the devices at every system StartUp and compared with the saved configuration.

#### Polled

# Produced/Consumed

Activation of the "Polling" mode, cyclic writing and reading of IO data. Setting of the data content of the data transmitted via the polled IO connections. You can choose from digital data, analog data or both. The selection depends upon the BK52xx terminal arrangement.

#### **Bit-Strobed**

#### **Produced/Consumed**

Activation of the "Bit Strobe" operating mode. A broadcast message requests all nodes to send their bit strobe message (up to 7 bytes input or status data). Setting of the data content of the data transmitted via the bit-strobed IO connections. You can choose between digital data or diagnostic data.

## Change of State / Cyclic

#### Produced/Consumed

Setting of the data content of the data transmitted via the change of state/cyclical IO connections. You can choose from digital data, analog data or both. The selection depends upon the BK52xx terminal arrangement.

# Change of State / Cyclic

Selection of the required operating mode.

# Heartbeat-Rate / Send-Rate

In the "Change of State" mode the heartbeat rate gives the cycle time of the cyclical send of the lower-level (i.e. in addition to the event driven) IO data. In "Cyclic" mode the send rate specifies the cycle time with which the IO data are sent.

#### Inhibit Time

Delay time in "Change of State" mode; after a change of state IO data are sent after the specified time at the earliest.

## Acknowledge Timeout

Time before the retransmission in the event of faulty acknowledgement of a change of state / cyclical message.

#### Acknowledge Retry Limit

Maximum number of re-sends until IO connection goes into error mode.

#### K-Bus update

Calculates the expected time required for a full update of the terminal bus (depends on the connected terminals).

#### Auto Device Replacement (ADR)

Not supported.

#### "Startup Attributes" tab

# 6.7 EtherCAT description

# 6.7.1 Introduction

The DeviceNet functionality and configuration options can be changed and parameterized depending on the different EtherCAT states.

# EtherCAT states

The EtherCAT states (INIT, PREOP, SAFEOP, OP) have the following meaning according to the fieldbus-specific functions:

EtherCAT state	Meaning
INIT	Fieldbus not running
PREOP	Load fieldbus configuration
SAFEOP	Fieldbus cyclic operation, safe state. Inputs are read, outputs are not written
OP	Fieldbus cyclic operation. Inputs are read, outputs are written

The procedure and the configuration options are described below

# 6.7.1.1 EL6752 DeviceNet master configuration

The DeviceNet master and the associated DeviceNet slaves are configured in EtherCAT state PREOP. The DeviceNet master parameters are written via the EtherCAT object 0xF800, the slave parameters are written via the EtherCAT objects from 0x80n0 [ $\blacktriangleright$  76], see section EtherCAT Object Description.

The EtherCAT states are mapped to DeviceNet as follows:

Fig. 60: EtherCAT states in mapping on EL6752-0000

The EtherCAT PDO mapping (EtherCAT objects 0x16yy, 0x1Ayy) and the PDO assignment (EtherCAT objects 0x1C12 [ $\triangleright$  78], 0x1C13 [ $\triangleright$  79]) can be read once the DeviceNet master parameters and the DeviceNet slave parameters have been written. The associated process image is then generated.

Once the DeviceNet master parameters have been written via the EtherCAT object 0xF800 [ 81], the DeviceNet master registers itself in the network and carries out the Duplicate MAC ID check.

# Starting the fieldbus

During the EtherCAT state transition from PREOP to SAFEOP the DeviceNet master starts the data communication with the slaves and allocates the configured operating modes. In EtherCAT state SAFEOP the DeviceNet master is in IDLE mode. During the EtherCAT state transition from SAFEOP to OP the DeviceNet master switches to RUN mode.

# Loading a new configuration

A new DeviceNet configuration can only be loaded through an EtherCAT state transition to IDLE or PREOP. The DeviceNet master parameters and DeviceNet slave parameters then have to be written again.

#### 6.7.1.2 EL6752-0010 DeviceNet slave configuration

The DeviceNet slaves are configured in EtherCAT state PREOP. The general DeviceNet slave parameters are written via the EtherCAT object 0xF800 [> 86], the slave configuration data, i.e. the communication features and the IO configuration are written via the EtherCAT object 0x8000 [> 82], see section EtherCAT Object Description.

The EtherCAT states are mapped to DeviceNet as follows:

# EtherCAT INIT

DeviceNet

Fig. 61: EtherCAT states in mapping on EL6752-0010

The EtherCAT PDO mapping (EtherCAT objects 0x1600 [▶ 83], 0x1A00 [▶ 83], 0x1A80) and the PDO assignment (EtherCAT objects 0x1C12 [ 84], 0x1C13 [ 84]) can be read once the DeviceNet slave parameters and the DeviceNet slave configuration data have been written. The associated process image is then generated.

Once the DeviceNet slave parameters have been written via the EtherCAT object 0xF800 [> 86], the DeviceNet slave registers itself in the network and carries out the Duplicate MAC ID check.

# Starting the fieldbus

During the EtherCAT state transition from PREOP to SAFEOP the DeviceNet slave starts the data communication, i.e. it is now ready for communication with a DeviceNet master. In EtherCAT state SAFEOP the DeviceNet slave is in IDLE mode. During the EtherCAT state transition from SAFEOP to OP the DeviceNet slave switches to RUN mode.

# Loading a new configuration

A new DeviceNet configuration can only be loaded through an EtherCAT state transition to IDLE or PREOP. The DeviceNet slave parameters and DeviceNet slave configuration data then have to be written again.

# 6.7.1.3 EL6752-0010 - Changing the DeviceNet address and baud rate using ADS

The DeviceNet address (MACId) and the baud rate of the EL6752-0010 DeviceNet Slave terminal can be set using an ADS command in addition to the familiar functions as already described in the chapter "Configuration with the <u>TwinCAT System Manager [ $\blacktriangleright$  50]"</u>

# ADS command

Setting the MAC-ID and the baud rate using ADS

```
IDXGRP=0x1F480
Index Offset 0x00
LEN=6
DATA[0]=0x45
DATA[1]=0x23
DATA[2]=MACId (0 _ 63)
DATA[3]=0
DATA[4]=Baudrate (1=500k, 2=250k, 3=125k)
DATA[5]=0
Ams Net Id: die der EL6752
Ams Port: 200
```

After writing the command the terminal must be switched once to INIT and then back to OP. The set data can be read in the object 0xF800 Index 1 (MAC ID) and Index 2 (baud rate).
#### Command taking the example of the TwinCAT AMS ADS Viewer

Test_ADS_Station_Addr.adg - AmsA	dsViewer				l		x
File Edit View Capture Display	Connection Analyze	Help					, ,

AmsViewer TCATAdsTest ADS_STATION_ADDR_Setzen ADS_STATION_ADDR_Löschen	Write Request General Index Hex Dec Index Group: 0x1F480 Index Offset: 0x0 String to write (hex): 45 23 3C 00 01 00 Error Code: 0x0 Transfer	GLOBAL	no error		Þ		
	TimeStamp	CmdId	Sender	Target	Error	hUser	d
	I €						•
Ready							

Fig. 62: ADS command with the data 3C - MACId (60dec) and 01 - baud rate (500k)

### Reset

Once the MAC ID and the baud rate have been set using the ADS command, the terminal stores the information persistently. Once these data have been written, the entries in the objects 0x8000:01, 0xF800:01 and 0xF800:02 are ignored! I This concerns the start-up commands, which are then ignored by the terminal.

Fig. 63: Example of start-up CMD (0x8000:01; 0xF800:01 and 0xF800:02) that are ignored by the slave terminal after successfully setting the MACId and baud rate using ADS

### ADS command (reset)

IDXGRP=0x1F480 Index Offset 0x00 LEN=6 DATA[0]=0 DATA[1]=0 DATA[2]=0 DATA[3]=0 DATA[4]=0 DATA[5]=0 Ams Net Id: die der EL6752 Ams Port: 200

In this way the data can be permanently deleted again and the terminal behaves as in the delivery condition.

### Reset command taking the example of the TwinCAT AMS ADS Viewer

## 6.7.2 Object description and parameterization

## 6.7.2.1 DeviceNet master - EL6752

## • EtherCAT XML Device Description

The display matches that of the CoE objects from the EtherCAT <u>XML</u> Device Description. We recommend downloading the latest XML file from the download area of the <u>Beckhoff website</u> and installing it according to installation instructions.

## Parameterization via the CoE list (CAN over EtherCAT)

The EtherCAT device is parameterized via the CoE-Online tab (double-click on the respective object) or via the Process Data tab (allocation of PDOs). Please note the following general <u>CoE</u> <u>notes [▶\_37]</u> when using/manipulating the CoE parameters:

- Keep a startup list if components have to be replaced
- Differentiation between online/offline dictionary, existence of current XML description
- use "CoE reload" for resetting changes

#### Introduction

The CoE overview contains objects for different intended applications:

- · Objects required for parameterization during commissioning
- Objects for indicating internal settings (may be fixed)

The parameterization and the objects required for normal operation will be presented first of all below. All further objects that are not needed for the normal application case can be found in the lower section of the table.

## 6.7.2.1.1 Objects for the parameterization

## Index 8000-803E configuration data

Index (hex)	Name	Meaning	Data type	Flags	Default

## 6.7.2.1.2 Objects for internal settings

## 6.7.2.1.2.1 Standard objects (0x1000-0x1FFF)

## Index 1000 Device type

Index (hex)	Name	Meaning	Data type	Flags	Default
1000:0	Device type	Device type of the EtherCAT slave: The Lo-Word contains the CoE profile used (5001). The Hi-Word contains the module profile according to the modular device profile.	UINT32	RO	0x14501389 (340792201 <sub>dec</sub> )

## Index 1008 Device name

Index (hex)	Name	Meaning	Data type	Flags	Default
1008:0	Device name	Device name of the EtherCAT slave	STRING	RO	EL6752

## Index 1009 Hardware version

Index (hex)	Name	Meaning	Data type	Flags	Default
1009:0	Hardware version	Hardware version of the EtherCAT slave	STRING	RO	00

## Index 100A Software version

Index (hex)	Name	Meaning	Data type	Flags	Default
100A:0	Software version	Firmware version of the EtherCAT slave	STRING	RO	00

## Index 1018 Identity

Index (hex)	Name	Meaning	Data type	Flags	Default
1018:0	Identity	Information for identifying the slave	UINT8	RO	0x04 (4 <sub>dec</sub> )
1018:01	Vendor ID	Vendor ID of the EtherCAT slave	UINT32	RO	0x0000002 (2 <sub>dec</sub> )
1018:02	Product code	Product code of the EtherCAT slave	UINT32	RO	0x1A603052 (442511442 <sub>dec</sub> )
1018:03	Revision	Revision number of the EtherCAT slave; the low word (bit 0-15) indicates the special terminal number, the high word (bit 16-31) refers to the device description	UINT32	RO	0x00100000 (1048576 <sub>dec</sub> )
1018:04	Serial number	Serial number of the EtherCAT slave; the low byte (bit 0-7) of the low word contains the year of production, the high byte (bit 8-15) of the low word contains the week of production, the high word (bit 16-31) is 0	UINT32	RO	0x0000000 (0 <sub>dec</sub> )

## Index 1A85 DNM TxPDO-Map Device

Index (hex)	Name	Meaning	Data type	Flags	Default
1A85:0	DNM TxPDO-Map Device	PDO Mapping TxPDO 134	UINT8	RW	0x09 (9 <sub>dec</sub> )
1A85:01	SubIndex 001	1. PDO Mapping entry (object 0xF100 (DeviceNet status), entry 0x01 (Communication status))	UINT32	RW	0xF100:01, 8
1A85:02	SubIndex 002	2. PDO Mapping entry (7 bits align)	UINT32	RW	0x0000:00, 7
1A85:03	SubIndex 003	3. PDO Mapping entry (object 0xF100 (DeviceNet status), entry 0x10 (TxPdoState))	UINT32	RW	0xF100:10, 1
1A85:04	SubIndex 004	4. PDO Mapping entry (object 0xF101 (Network status), entry 0x01 (Device status))	UINT32	RW	0xF101:01, 8
1A85:05	SubIndex 005	5. PDO Mapping entry (object 0xF101 (Network status), entry 0x09 (CAN BUS-OFF))	UINT32	RW	0xF101:09, 1
1A85:06	SubIndex 006	6. PDO Mapping entry (object 0xF101 (Network status), entry 0x0A (CAN warning limit))	UINT32	RW	0xF101:0A, 1
1A85:07	SubIndex 007	7. PDO Mapping entry (object 0xF101 (Network status), entry 0x0B (CAN Overrun))	UINT32	RW	0xF101:0B, 1
1A85:08	SubIndex 008	8. PDO Mapping entry (5 bits align)	UINT32	RW	0x0000:00, 5
1A85:09	SubIndex 009	9. PDO Mapping entry (object 0xF101 (Network status), entry 0x11 (CAN BUS load))	UINT32	RW	0xF101:11, 16

## Index 1C00 Sync manager type

Index (hex)	Name	Meaning	Data type	Flags	Default
1C00:0	Sync manager type	Using the sync managers	UINT8	RO	0x04 (4 <sub>dec</sub> )
1C00:01	SubIndex 001	Sync-Manager Type Channel 1: Mailbox Write	UINT8	RO	0x01 (1 <sub>dec</sub> )
1C00:02	SubIndex 002	Sync-Manager Type Channel 2: Mailbox Read	UINT8	RO	0x02 (2 <sub>dec</sub> )
1C00:03	SubIndex 003	Sync-Manager Type Channel 3: Process Data Write (Outputs)	UINT8	RO	0x03 (3 <sub>dec</sub> )
1C00:04	SubIndex 004	Sync-Manager Type Channel 4: Process Data Read (Inputs)	UINT8	RO	0x04 (4 <sub>dec</sub> )

## Index 1C12 RxPDO assign

Index (hex)	Name	Meaning	Data type	Flags	Default
1C12:0	RxPDO assign	PDO Assign Outputs	UINT8	RW	0x00 (0 <sub>dec</sub> )
1C12:01		1 <sup>st</sup> allocated RxPDO (contains the index of the associated RxPDO mapping object)			
1C12:FF		255 <sup>th</sup> allocated RxPDO (contains the index of the associated RxPDO mapping object)			

## Index 1C13 TxPDO assign

Index (hex)	Name	Meaning	Data type	Flags	Default
1C13:0	TxPDO assign	PDO Assign Inputs	UINT8	RW	0x01 (1 <sub>dec</sub> )
1C13:01		1 <sup>st</sup> allocated TxPDO (contains the index of the associated TxPDO mapping object)			
1C13:FF		255 <sup>th</sup> allocated TxPDO (contains the index of the associated TxPDO mapping object)			

## 6.7.2.1.2.2 **Profile-specific objects (0x6000-0xFFFF)**

The profile-specific objects have the same meaning for all EtherCAT slaves that support the profile 5001.

## Index 6000-603E Poll Produced Data

Index (hex)	Name	Meaning	Data type	Flags	Default
6000+n*16: 0	Poll Produced Data	Output data of the polling connection	UINT8	RO	0x01 (1 <sub>dec</sub> )
(6000+n*16) :01					
(6000+n*16) :01					

### Index 6001-603F COS Produced Data

Index (hex)	Name	Meaning	Data type	Flags	Default
6001+n*16: 0	COS Produced Data	Output data of the change of state connection	UINT8	RO	0x01 (1 <sub>dec</sub> )
(6001+n*16) :01					
(6001+n*16) :01					

## Index 7000-703E Poll Consumed Data

Index (hex)	Name	Meaning	Data type	Flags	Default
7000+n*16: 0	Poll Consumed Data	Input data of the polling connection	UINT8	RO	0x01 (1 <sub>dec</sub> )
(7000+n*16) :01					
(7000+n*16) :01					

## Index 7001-703F COS Consumed Data

Index (hex)	Name	Meaning	Data type	Flags	Default
7001+n*16: 0	COS Consumed Data	Input data of the change of state connection	UINT8	RO	0x01 (1 <sub>dec</sub> )
(7001+n*16) :01					
(7001+n*16) :01					

## Index F000 Modular device profile

Index (hex)	Name	Meaning	Data type	Flags	Default
F000:0	Modular device profile	General information for the modular device profile	UINT8	RO	0x02 (2 <sub>dec</sub> )
F000:01	Module index distance	Index distance of the objects of the individual channels	UINT16	RO	0x0010 (16 <sub>dec</sub> )
F000:02	Maximum number of modules	Number of channels	UINT16	RO	0x00FF (255 <sub>dec</sub> )

## Index F008 Code word

Index (hex)	Name	Meaning	Data type	Flags	Default
F008:0	Code word	reserved	UINT32	RW	0x00000000
					(O <sub>dec</sub> )

## Index F010 Module list

Index (hex)	Name	Meaning	Data type	Flags	Default
F010:0	Module list	List of the DeviceNet slaves connected to the EL6752.	UINT8	RW	0x00 (0 <sub>dec</sub> )
F010:01		Product code of the first DeviceNet slave	UINT16	RO	0x00 (0 <sub>dec</sub> )
F010:FF					

### Index F100 DeviceNet status

Index (hex)	Name	Meaning	Data type	Flags	Default
F100:0	DeviceNet status	DeviceNet status of the EL6752	UINT8	RO	0x10 (16 <sub>dec</sub> )
F100:01	Number of Slaves not in Run	Number of DeviceNet slaves that are not in the RUN state	UINT8	RO	0x00 (0 <sub>dec</sub> )
F100:10	TxPdoState	Status of the Tx-PDO	BOOLEAN	RO	0x00 (0 <sub>dec</sub> )

## Index F101 Network status

Index (hex)	Name	Meaning	Data type	Flags	Default
F101:0	Network status	Max. Subindex	UINT8	RO	0x11 (17 <sub>dec</sub> )
F101:01	Device status	0: RUN MODE 1: IDLE MODE 2: Duplicate MacId Check failed, MAC ID used 3: Status: Selftest 4: Status: Standby 5: Status:Major Recoverable Fault 6: Status:Minor Recoverable Fault 7: DeviceNet Voltage Error 8: DeviceNet Access Error	UINT8	RO	0x00 (0 <sub>dec</sub> )
F101:09	CAN BUS-OFF	CAN controller of the EL6752 is in state bus-off	BOOLEAN	RO	0x00 (0 <sub>dec</sub> )
F101:0A	CAN warning limit	CAN controller of the EL6752 has exceeded the warning limit	BOOLEAN	RO	0x00 (0 <sub>dec</sub> )
F101:0B	CAN Overrun	CAN controller of the EL6752 is in state bus-off	BOOLEAN	RO	0x00 (0 <sub>dec</sub> )
F101:11	CAN BUS load	CAN bus load 0 - 100%	UINT16	RO	0x0000 (0 <sub>dec</sub> )

### Index F800 bus parameter set

Index (hex)	Name	Meaning	Data type	Flags	Default
F800:0	Bus Parameter set	Max. Subindex	UINT8	RW	0x08 (8 <sub>dez</sub> )
F800:01	MAC ID	Device address of the DeviceNet device (see DeviceNet specification)	UINT16	RW	0x0000 (0 <sub>dec</sub> )
F800:03	Product Name	Product name of the DeviceNet device (see DeviceNet specification)	OCTET- STRING[32]	RW	{0}
F800:04	DeviceType	Device type of the DeviceNet device (see DeviceNet specification)	UINT16	RW	0x0000 (0 <sub>dec</sub> )
F800:05	Vendor ID	Manufacturer ID of the DeviceNet device (see DeviceNet specification)	UINT16	RW	0x0000 (0 <sub>dec</sub> )
F800:06	Product Code	Product code of the DeviceNet device (see DeviceNet specification)	UINT16	RW	0x0000 (0 <sub>dec</sub> )
F800:07	Revision Number	Version number of the DeviceNet device (see DeviceNet specification)	UINT16	RW	0x0000 (0 <sub>dec</sub> )
F800:08	Serial Number	Serial number of the DeviceNet device (see DeviceNet specification)	UINT32	RW	0x00350000 (3473408 <sub>dec</sub> )
F800:09	Baud rate	DeviceNet Baud Rate	UINT16	RW	0x0100 (256 <sub>dec</sub> )

## 6.7.2.2 DeviceNet Slave - EL6752-0010

## EtherCAT XML Device Description

The display matches that of the CoE objects from the EtherCAT <u>XML</u> Device Description. We recommend downloading the latest XML file from the download area of the <u>Beckhoff website</u> and installing it according to installation instructions.

## Parameterization via the CoE list (CAN over EtherCAT)

The EtherCAT device is parameterized via the CoE-Online tab (double-click on the respective object) or via the Process Data tab (allocation of PDOs). Please note the following general <u>CoE</u> <u>notes [ $\blacktriangleright$  37]</u> when using/manipulating the CoE parameters:

- Keep a startup list if components have to be replaced
- Differentiation between online/offline dictionary, existence of current XML description
- use "CoE reload" for resetting changes

### Introduction

The CoE overview contains objects for different intended applications:

- Objects required for parameterization during commissioning
- Objects for indicating internal settings (may be fixed)

The parameterization and the objects required for normal operation will be presented first of all below. All further objects that are not needed for the normal application case can be found in the lower section of the table.

## 6.7.2.2.1 Objects for the parameterization

8000:08	Serial Number	Serial number (see DeviceNet specification)	UINT32	RW	0x0000000 (0 <sub>dec</sub> )
8000:1D	Network Flags	Reserved for AMS via DeviceNet	UINT16	RW	0x0000 (0 <sub>dec</sub> )
8000:1E	Network Port	Reserved for AMS via DeviceNet	UINT16	RW	0x0000 (0 <sub>dec</sub> )
8000:1F	Network Segment Address	Reserved for AMS via DeviceNet	OCTET- STRING[2]	RW	{0}
8000:20	Allocation Choice	DeviceNet mode selection (see DeviceNet specification)	UINT16	RW	0x0100
		Bit 0: reserved (0)			(256 <sub>dec</sub> )
		Bit 1: Polled			
		Bit 2: Bit-Strobed			
		Bit 3: reserved (0)			
		Bit 4: Change of State			
		Bit 5: Cyclic			
		Bit 6: Acknowledge Suppression			
		Bit 7: reserved(0)			
8000:21	Expected Packet Rate - Poll	Timing parameter for the poll connection (see DeviceNet specification)	UINT16	RW	0x0000 (0 <sub>dec</sub> )
8000:22	Expected Packet Rate - Bit Strobe	Timing parameter for the bit strobe connection (see DeviceNet specification)	UINT16	RW	0x0000 (0 <sub>dec</sub> )
8000:23	Expected Packet Rate - COS/Cyclic	Timing parameter for the COS/cyclic connection (see DeviceNet specification)	UINT16	RW	0x0000 (0 <sub>dec</sub> )
8000:24	Produced Data Size - Poll	Data length in poll mode	UINT16	RW	0x0000 (0 <sub>dec</sub> )
8000:25	Produced Data Size - Bit Strobe	Data length in bit strobe mode	UINT16	RW	0x0000 (0 <sub>dec</sub> )
8000:26	Produced Data Size - COS/Cyclic	Data length in change of state / cyclic mode	UINT16	RW	0x0000 (0 <sub>dec</sub> )
8000:27	Consumed Data Size - Poll	Data length in poll mode	UINT16	RW	0x0000 (0 <sub>dec</sub> )
8000:28	Consumed data size - Bit strobe	Data length in bit strobe mode	UINT16	RW	0x0000 (0 <sub>dec</sub> )
8000:29	Consumed Data Size - COS/Cyclic	Data length in change of state / cyclic mode	UINT16	RW	0x0000 (0 <sub>dec</sub> )

## 6.7.2.2.2 Objects for internal settings

## 6.7.2.2.2.1 Standard objects (0x1000-0x1FFF)

The standard objects have the same meaning for all EtherCAT slaves.

### Index 1000 Device type

Index (hex)	Name	Meaning	Data type	Flags	Default
1000:0	Device type	Device type of the EtherCAT slave: The Lo-Word contains the CoE profile used (5001). The Hi-Word contains the module profile according to the modular device profile.	UINT32	RO	0x145A1389 (341447561 <sub>dec</sub> )

#### Index 1008 Device name

Index (hex)	Name	Meaning	Data type	Flags	Default
1008:0	Device name	Device name of the EtherCAT slave	STRING	RO	EL6752-0010

### Index 1009 Hardware version

Index (hex)	Name	Meaning	Data type	Flags	Default
1009:0	Hardware version	Hardware-Version des EtherCAT-Slaves	STRING	RO	00

### Index 100A Software version

Index (hex)	Name	Meaning	Data type	Flags	Default
100A:0	Software version	Firmware version of the EtherCAT slave	STRING	RO	00

## Index 1018 Identity

Index (hex)	Name	Meaning	Data type	Flags	Default
1018:0	Identity	Information for identifying the slave	UINT8	RO	0x04 (4 <sub>dec</sub> )
1018:01	Vendor ID	Vendor ID of the EtherCAT slave	UINT32	RO	0x0000002 (2 <sub>dec</sub> )
1018:02	Product code	Product code of the EtherCAT slave	UINT32	RO	0x1A603052 (442511442 <sub>dec</sub> )
1018:03	Revision	Revision number of the EtherCAT slave; the low word (bit 0-15) indicates the special terminal number, the high word (bit 16-31) refers to the device description	UINT32	RO	0x0010000A (1048586 <sub>dec</sub> )
1018:04	Serial number	Serial number of the EtherCAT slave; the low byte (bit 0-7) of the low word contains the year of production, the high byte (bit 8-15) of the low word contains the week of production, the high word (bit 16-31) is 0	UINT32	RO	0x0000000 (0 <sub>dec</sub> )

#### Index 1600 DNS RxPDO-Map

Index (hex)	Name	Meaning	Data type	Flags	Default
1600:0	DNS RxPDO-Map	PDO Mapping RxPDO 1	UINT8	RW	0x00 (0 <sub>dec</sub> )
1600:01					
1600:FF					

## Index 1A00 DNS TxPDO-Map

Index (hex)	Name	Meaning	Data type	Flags	Default
1A00:0	DNS TxPDO-Map	PDO Mapping TxPDO 1	UINT8	RW	0x00 (0 <sub>dec</sub> )
1A00:01					
1A00:FF					

## Index 1A01 DNM TxPDO-Map Device

Index (hex)	Name	Meaning	Data type	Flags	Default
1A01:0	DNM TxPDO-Map Device	PDO Mapping TxPDO 2	UINT8	RW	0x09 (9 <sub>dec</sub> )
1A01:01	SubIndex 001	1. PDO Mapping entry (object 0xF100 (DeviceNet status), entry 0x01 (Communication status))	UINT32	RW	0xF100:01, 8
1A01:02	SubIndex 002	2. PDO Mapping entry (7 bits align)	UINT32	RW	0x0000:00, 7
1A01:03	SubIndex 003	3. PDO Mapping entry (object 0xF100 (DeviceNet status), entry 0x10 (TxPdoState))	UINT32	RW	0xF100:10, 1
1A01:04	SubIndex 004	4. PDO Mapping entry (object 0xF101 (Network status), entry 0x01 (Device status))	UINT32	RW	0xF101:01, 8
1A01:05	SubIndex 005	5. PDO Mapping entry (object 0xF101 (Network status), entry 0x09 (CAN BUS-OFF))	UINT32	RW	0xF101:09, 1
1A01:06	SubIndex 006	6. PDO Mapping entry (object 0xF101 (Network status), entry 0x0A (CAN warning limit))	UINT32	RW	0xF101:0A, 1
1A01:07	SubIndex 007	7. PDO Mapping entry (object 0xF101 (Network status), entry 0x0B (CAN Overrun))	UINT32	RW	0xF101:0B, 1
1A01:08	SubIndex 008	8. PDO Mapping entry (5 bits align)	UINT32	RW	0x0000:00, 5
1A01:09	SubIndex 009	9. PDO Mapping entry (object 0xF101 (Network status), entry 0x11 (CAN BUS load))	UINT32	RW	0xF101:11, 16

## Index 1C00 Sync manager type

Index (hex)	Name	Meaning	Data type	Flags	Default
1C00:0	Sync manager type	Using the sync managers	UINT8	RO	0x04 (4 <sub>dec</sub> )
1C00:01	SubIndex 001	Sync-Manager Type Channel 1: Mailbox Write	UINT8	RO	0x01 (1 <sub>dec</sub> )
1C00:02	SubIndex 002	Sync-Manager Type Channel 2: Mailbox Read	UINT8	RO	0x02 (2 <sub>dec</sub> )
1C00:03	SubIndex 003	Sync-Manager Type Channel 3: Process Data Write (Outputs)	UINT8	RO	0x03 (3 <sub>dec</sub> )
1C00:04	SubIndex 004	Sync-Manager Type Channel 4: Process Data Read (Inputs)	UINT8	RO	0x04 (4 <sub>dec</sub> )

## Index 1C12 RxPDO assign

Index (hex)	Name	Meaning	Data type	Flags	Default
1C12:0	RxPDO assign	PDO Assign Outputs	UINT8	RW	0x01 (1 <sub>dec</sub> )
1C12:01	SubIndex 001	1 <sup>st</sup> allocated RxPDO (contains the index of the associated RxPDO mapping object)	UINT16	RW	0x1600 (5632 <sub>dec</sub> )

#### Index 1C13 TxPDO assign

Index (hex)	Name	Meaning	Data type	Flags	Default
1C13:0	TxPDO assign	PDO Assign Inputs	UINT8	RW	0x02 (2 <sub>dec</sub> )
1C13:01	SubIndex 001	1 <sup>st</sup> allocated TxPDO (contains the index of the associated TxPDO mapping object)	UINT16	RW	0x1A00 (6656 <sub>dec</sub> )
1C13:02	SubIndex 002	2 <sup>nd</sup> allocated TxPDO (contains the index of the associated TxPDO mapping object)	UINT16	RW	0x1A01 (6657 <sub>dec</sub> )

## 6.7.2.2.2.2 Profile-specific objects (0x6000-0xFFFF)

The profile-specific objects have the same meaning for all EtherCAT slaves that support the profile 5001.

### Index 6000 Poll Produced Data

Index (hex)	Name	Meaning	Data type	Flags	Default
6000:0	Poll Produced Data	Output data of the polling connection	UINT8	RO	0x01 (1 <sub>dec</sub> )
6000:01					
6000:01					

## Index 6001 COS Produced Data

Index (hex)	Name	Meaning	Data type	Flags	Default
6001:0	COS Produced Data	Output data of the change of state connection	UINT8	RO	0x01 (1 <sub>dec</sub> )
6001:01					
6001:01					

#### Index 7000 Poll Consumed Data

Index (hex)	Name	Meaning	Data type	Flags	Default
7000:0	Poll Consumed Data	Input data of the polling connection	UINT8	RO	0x01 (1 <sub>dec</sub> )
7000:01					
7000:01					

## Index 7001 COS Consumed Data

Index (hex)	Name	Meaning	Data type	Flags	Default
7001:0	COS Consumed Data	Input data of the change of state connection	UINT8	RO	0x01 (1 <sub>dec</sub> )
7001:01					
7001:01					

## Index F000 Modular device profile

Index (hex)	Name	Meaning	Data type	Flags	Default
F000:0	Modular device profile	General information for the modular device profile	UINT8	RO	0x02 (2 <sub>dec</sub> )
F000:01	Module index distance	Index distance of the objects of the individual channels	UINT16	RO	0x0010 (16 <sub>dec</sub> )
F000:02	Maximum number of modules	Number of channels	UINT16	RO	0x0001 (1 <sub>dec</sub> )

## Index F008 Code word

Index (hex)	Name	Meaning	Data type	Flags	Default
F008:0	Code word	reserved	UINT32	RW	0x00000000
					(O <sub>dec</sub> )

## Index F010 Module list

Index (hex)	Name	Meaning	Data type	Flags	Default
F010:0	Module list	List of connected devices	UINT8	RW	0x01 (1 <sub>dec</sub> )
F010:01	SubIndex 001	Product code EL6752-0010	UINT32	RW	0x0000145A (5210 <sub>dec</sub> )

## Index F100 DeviceNet status

Index (hex)	Name	Meaning	Data type	Flags	Default
F100:0	DeviceNet status	DeviceNet status of the EL6752-0010	UINT8	RO	0x10 (16 <sub>dec</sub> )
F100:01	Communication status	Communication status of the EL6752-0010: 0 = No error 1 = Station deactivated 2 = Station not exists 18 = Station ready 31 = only for EtherCAT gateways: WC-State of cyclic EtherCAT frame is 1	UINT8	RO	0x00 (0 <sub>dec</sub> )
F100:10	TxPdoState	Status of the Tx-PDO	BOOLEAN	RO	0x00 (0 <sub>dec</sub> )

## Index F101 Network status

Index (hex)	Name	Meaning	Data type	Flags	Default
F101:0	Network status	Max. Subindex	UINT8	RO	0x11 (17 <sub>dec</sub> )
F101:01	Device status	0: RUN MODE 1: IDLE MODE 2: Duplicate MacId Check failed, MAC ID used 3: Status: Selftest 4: Status: Standby 5: Status:Major Recoverable Fault 6: Status:Minor Recoverable Fault 7: DeviceNet Voltage Error 8: DeviceNet Access Error	UINT8	RO	0x00 (0 <sub>dec</sub> )
F101:09	CAN BUS-OFF	CAN controller of the EL6752-0010 is in state bus-off	BOOLEAN	RO	0x00 (0 <sub>dec</sub> )
F101:0A	CAN warning limit	CAN controller of the EL6752-0010 has exceeded the warning limit	BOOLEAN	RO	0x00 (0 <sub>dec</sub> )
F101:0B	CAN Overrun	CAN controller of the EL6752-0010 is in state bus-off	BOOLEAN	RO	0x00 (0 <sub>dec</sub> )
F101:11	CAN BUS load	CAN bus load 0 - 100 %	UINT16	RO	0x0000 (0 <sub>dez</sub> )

## Index F800 bus parameter set

Index (hex)	Name	Meaning	Data type	Flags	Default
F800:0	Bus Parameter set	Max. Subindex	UINT8	RW	0x08 (8 <sub>dec</sub> )
F800:01	MAC ID	Device address of the DeviceNet device (see DeviceNet specification)	UINT16	RW	0x0000 (0 <sub>dec</sub> )
F800:03	Product Name	Product name of the DeviceNet device (see DeviceNet specification)	OCTET- STRING[32]	RW	{0}
F800:04	DeviceType	Device type of the DeviceNet device (see DeviceNet specification)	UINT16	RW	0x0000 (0 <sub>dec</sub> )
F800:05	Vendor ID	Manufacturer ID of the DeviceNet device (see DeviceNet specification)	UINT16	RW	0x0000 (0 <sub>dec</sub> )
F800:06	Product Code	Product code of the DeviceNet device (see DeviceNet specification)	UINT16	RW	0x0000 (0 <sub>dec</sub> )
F800:07	Revision Number	Version number of the DeviceNet device (see DeviceNet specification)	UINT16	RW	0x0000 (0 <sub>dec</sub> )
F800:08	Serial Number	Serial number of the DeviceNet device (see DeviceNet specification)	UINT32	RW	0x00350000 (3473408 <sub>dec</sub> )
F800:09	Baud rate	DeviceNet Baud Rate	UINT16	RW	0x0100 (256 <sub>dec</sub> )

# 7 Error handling and diagnostics

## 7.1 EL6752 - LED description

Fig. 65: LEDs

## LED behaviour

The LEDs facilitate diagnosing of the main terminal states:

## EL6752-0000 (DeviceNet master terminal)

LED	Colours	Meaning	leaning		
RUN	green	This LED ind	icates the terminal's operating state:		
		off	State of the EtherCAT State Machine: INIT = initialization of the terminal; BOOTSTRAP = function for terminal firmware updates		
		flashing	State of the EtherCAT State Machine: <b>PREOP</b> = function for mailbox communication and different standard-settings set		
		Single flash	State of the EtherCAT State Machine: <b>SAFEOP</b> = verification of the sync manager channels and the distributed clocks. Outputs remain in safe state		
		on	State of the EtherCAT State Machine: <b>OP</b> = normal operating state; mailbox and process data communication is possible		
MNS green	green	off	Master is offline		
		flashing	Master is online and is performing the Duplicate MAC-ID check		
		on	Master is online and is communicating with the configured slaves		
MNS red	red	flashing	Communication error of the master with one of the configured slaves		
		on	DeviceNet Bus OFF, DeviceNet voltage error, Master failed Duplicate MAC-ID check		

## EL6752-0010 (DeviceNet slave terminal)

LED	Color	Meaning	Meaning		
RUN	green	This LED inc	licates the terminal's operating state:		
		off	State of the EtherCAT State Machine: INIT = initialization of the terminal; BOOTSTRAP = function for terminal firmware updates		
		flashing	State of the EtherCAT State Machine: <b>PREOP</b> = function for mailbox communication and different standard-settings set		
		Single flash	State of the EtherCAT State Machine: <b>SAFEOP</b> = verification of the sync manager channels and the distributed clocks. Outputs remain in safe state		
		on	State of the EtherCAT State Machine: <b>OP</b> = normal operating state; mailbox and process data communication is possible		
MNS green	green	off	Slave is offline		
		flashing	Slave port has ended the Duplicate MAC-ID check (Network OK), communication error with the master.		
		on	Slave port is online and is communicating with the master.		
MNS red	red	flashing	Communication error of the slave port with the master, timeout of the slave port		
		on	DeviceNet Bus OFF, DeviceNet voltage error, slave port error, error in Duplicate MAC-ID check		

## 7.2 EL6752/-0010 diagnostics

The EL6752/-0010 feature various diagnostic variables that describe the state of the terminal and the DeviceNet and can be linked in the PLC:

## We recommend monitoring the following process data during each cycle:

- WcState: if ≠ 0, this EtherCAT device does not take part in the process data traffic
- **State**: if  $\neq$  8, the EtherCAT device is not in OP (operational) status

## We recommend monitoring the following process data:

- Error: if ≠ 0, the indicated number of DeviceNet devices has a BoxState not equal zero, i.e. check which DeviceNet devices are not operating correctly in the bus
- DiagFlag: indicates pending diagnostic data

## 7.2.1 EL6752/-0010 - WC-State

For monitoring the EtherCAT communication the WC state (working counter) of the EL6752/-0010 must be checked. If the WC state is not equal "0" the EtherCAT communication is disturbed, i.e. data sent to the slave or the master are no longer transferred correctly and are not valid.

Fig. 66: WCState in the TwinCAT tree

### WcState

- 0: data are valid
- 1: data are not valid, problem in the EtherCAT communication

#### 7.2.2 EL6752/-0010 - State

The diagnostic state variable indicates the current EtherCAT state of the EL6752/-0010.

Fig. 67: State diagnostic variable in the TwinCAT tree

#### State

- 0x 1 = Slave in 'INIT' state

- $0x_2 = Slave in 'PREOP' state$   $0x_3 = Slave in 'BOOT' state$   $0x_4 = Slave in 'SAFEOP' state$   $0x_8 = Slave in 'OP' state$
- 0x001\_ = Slave signals error
- 0x002\_ = Invalid vendorld, productCode... read
- 0x004 = Initialization error occurred
- 0x010 = Slave not present
- 0x020 = Slave signals link error
- 0x040 = Slave signals missing link
- 0x080 = Slave signals unexpected link
- 0x100 = Communication port A
- 0x200 = Communication port B
- 0x400 = Communication port C
- 0x800 = Communication port D

## 7.2.3 EL6752/-0010 - Error / DiagFlag

😥 🔫 Device 1 (EtherCAT) 🚊 😓 Device 2 (EL6752) 📥 Device 2 (EL6752)-Image 🚊 😵 Inputs **♦**† Error <mark>;}}↑</mark> DiagFlag 🗄 🌃 Box 2 (BK5220) 🗄 🚻 Box 10 (BK5250) 🗄 🌌, Box 8 (EL6752-0010) 🗄 🔜 Box 10 (DN Node) 😑 🚖 Device 3 (EL6752-0010) 🕂 🕂 Device 3 (EL6752-0010)-Image 🚊 😵 😫 📄 ♦↑ Error 🔶 DiagFlag 🖮 🏧, Box 1 (EL6752-0010)

Fig. 68: Error and DiagFlag in the TwinCAT tree

## Error

0: all DeviceNet devices have BoxState zero >0: number of DeviceNet devices with BoxState not equal zero.

## DiagFlag

0 = no diagnostic data are pending

1 = diagnostic data are pending and can be read via AdsRead services

## 7.3 **DeviceNet device diagnostics**

DeviceNet slave devices feature different diagnostic variables that describe the DeviceNet communication state and can be linked in the PLC:

## We recommend monitoring the following process data during each cycle:

- MacState: if ≠ 0, this DeviceNet device is not participating correctly in the process data traffic
- **CouplerState**: for Beckhoff Bus Couplers, the terminal communication of the Bus Coupler may be disturbed or diagnostic data may be present if ≠ 0

## 7.3.1 DeviceNet slave device / EL6752-0010 - MacState

For monitoring the DeviceNet communication the MacState of the DeviceNet device / EL6752-0010 must be checked. If the MacState is not equal zero, the DeviceNet slave is not participating correctly in the DeviceNet data exchange.

Fig. 69: MacState in the TwinCAT tree

## MacState

- 0 = No error
- 1 = Station deactivated
- 2 = Station not exists
- 18 = Station ready
- 40 = Heartbeat Message not received
- 41 = Shutdown Message received
- 42 = Electronic Key Fault: Vendor Id
- 43 = Electronic Key Fault: Device Type

- 44 = Electronic Key Fault: Product Code
  45 = Electronic Key Fault: Revision
  46 = Fault while writing Start-Up Attributs
  47 = wrong Produced IO-Data Size
  48 = wrong Consumed IO-Data Size
  49 = Idle Mode

## 7.3.2 DeviceNet slave device / EL6752-0010 - DiagFlag

The DiagFlag indicates pending diagnostic data. Pending diagnostic data can be read via an AdsRead command.

Fig. 70: DiagFlag in the TwinCAT tree

## DiagFlag

0 = no diagnostic data are pending

1 = diagnostic data are pending and can be read via AdsRead services

## 7.3.3 Beckhoff DeviceNet slave device - CouplerState

The CouplerState provides information on the terminal bus communication of the Beckhoff Bus Coupler. This information is available for Beckhoff BK52x0 Bus Couplers, devices from the IPxxxx-B520 IP Box-family and the IP Link family.

Fig. 71: CouplerState in the TwinCAT tree

## CouplerState

0x00 = I/O Run

0x01 = I/O Error (KBus, IO or Terminal Error)

0x80 = I/O idle mode / fieldbus error, no output data are written

0x08= diagnostic information for an analog/special function terminal is pending. This function first hast to be activated at the couplers. The diagnostic data can then be read in the associated registers of the terminals, IP/IL modules

## 7.4 EL6752/-0010 - ADS Error Codes

The ADS error codes have the following meaning:

Error	or Description			
	Error during ADS/AMS data exchange			
0x1001	Insufficient memory for AMS command			
0x1101	Incorrect data length at StartFieldbus			
0x1102	Incorrect DeviceState at StartFieldbus			
0x1103	Device cannot change from INIT to RUN			
0x1104	Incorrect AdsState in INIT state			
0x1105	Incorrect DeviceState at StopFieldbus			
0x1106	Device cannot change from STOP to RUN if a CDL is not defined			
0x1107	Device cannot change from STOP to RUN if a box is not defined			
0x1108	Incorrect data length at StartDataTransfer			
0x1109	Incorrect DeviceState at StartDataTransfer			
0x110A	Incorrect AdsState in STOP state			
0x110B	Device cannot change from RUN to INIT			
0x110C	Incorrect data length at StopDataTransfer			
0x110D	Incorrect DeviceState at StopDataTransfer			
0x1110	Incorrect AdsState in RUN state			
0x1111	Loading the device parameters is only permitted in the INIT state			
0x1112	Incorrect data length at SetDeviceState			
0x1113	AddBox not allowed in INIT state			
0x1114	Incorrect data length at AddBox			
0x1115	DeleteBox not allowed in INIT state			
0x1116	Incorrect IndexOffset at DeleteBox			
0x1117	Incorrect data length at DeleteBox			
0x1118	ReadBox only with AdsRead			
0x1119	AddCdl not allowed in INIT state			
0x111A	Incorrect data length at AddCdl			
0x111B	DeleteCdl not allowed in INIT state			
0x111C	Incorrect IndexOffset at DeleteCdl			
0x111D	Incorrect data length at DeleteCdl			
0x111E	Incorrect IndexGroup at AdsWrite			
0x111F	Device parameters cannot be read			

Error	Description		
	Error during ADS/AMS data exchange		
0x1120	Box parameters cannot be read		
0x1121	Cdl parameters cannot be read		
0x1122	DeleteBox or DeleteCdl only with AdsWrite		
0x1123	ReadBox only possible in STOP state		
0x1124	Incorrect IndexOffset at ReadBox		
0x1125	Incorrect data length at ReadBox		
0x1126	Incorrect IndexGroup at AdsRead		
0x1127	AddDeviceNotification not allowed in INIT state		
0x1128	DelDeviceNotification not allowed in INIT state		
0x1129	IndexOffset too large during reading of the device diagnostic data		
0x112B	IndexOffset too large during reading of the box diagnostic data		
0x112F	Insufficient memory for ReadBox response		
0x1201	AddCdl: CDL no. is too large		
0x1202	DeleteCdl only possible when CDL is stopped		
0x1203	DeleteCdl not possible as no CDL defined		
0x1204	Cycle could not be completed within the internal watchdog time		
0x1301	AddCdl: I/O access multiplier is too large		
0x1302	AddCdl: Start cycle must be smaller than I/O access multiplier		
0x1303	AddCdl: Incorrect data length for output area		
0x1304	AddCdl: Incorrect data offset for output area		
0x1305	AddCdl: Output area is already defined		
0x1306	AddCdl: Incorrect data length for input area		
0x1307	AddCdl: Incorrect data offset for input area		
0x1308	AddCdl: Input area is already defined		
0x1309	AddCdl: Incorrect area type		
0x130A	AddCdl: BoxNo has not been defined with AddBox		
0x130B	AddCdl: Incorrect action type		
0x130C	AddCdl: Insufficient memory for poll list		
0x130D	AddCdl: Insufficient memory for poll list array		
0x130E	AddCdl: Insufficient memory for actions		
0x130F	AddCdl: CdlNo already exists		

Error	Description		
	Error during ADS/AMS data exchange		
0x1310	DeleteCdl: CDL is not stopped		
0x1311	AddCdl: Insufficient memory for asynchronous transmit list		
0x1312	AddCdl: Insufficient memory for synchronous receive list		
0x1313	AddCdl: Insufficient memory for asynchronous receive list		
0x1316	AddCdl: Insufficient memory for synchronous receive list		
0x1318	AddCdl: Only slave action allowed		
0x1319	AddCdl: Insufficient memory for slave list		
0x1601	AddBox: BoxNo is too large		
0x1602	AddBox: Insufficient memory for ADS StartUp telegram		
0x1604	DeleteBox: Box is not stopped		
0x1605	AddBox: Insufficient memory for CDL telegram

## 7.5 DeviceNet / CAN Trouble Shooting

## **Error Frames**

One sign of errors in the CAN wiring, the address assignment or the setting of the baud rate is an increased number of error frames: the diagnostic LEDs then show *Warning Limit exceeded* or *Bus-off state entered*.

## DeviceNet / CAN network analysis

CAN warning limit exceeded, passive error or bus-off state are indicated first of all at the node that has detected the most errors. These nodes are not necessarily the cause for the occurrence of error frames! If, for instance, one node contributes unusually heavily to the bus traffic (e.g. because it is the only one with analog inputs, the data for which triggers event-driven messages at a high rate), then the probability of its telegrams being damaged increases. Its error counter will, correspondingly, be the first to reach a critical level.

### MAC ID / baud rate setting

Duplicate allocation of node addresses / MAC IDs must be avoided.

### Test 1

Check MAC ID. If the DeviceNet communication works at least temporarily and all devices support the duplicate MAC ID check, the address assignment can also be checked by logging the duplicate MAC ID check messages when the devices are switched on, although this procedure does not detect incorrect allocation of node addresses.

## Test 2

Check that the same baud rate has been set everywhere.

### Testing the DeviceNet/CAN cabling

These tests should not be carried out if the network is active: No communication should take place during the tests. The following tests should be carried out in the stated sequence, because some of the tests assume that the previous test was successful. Not all the tests are generally necessary.

### Network terminator and signal leads

The nodes should be switched off or the CAN cable unplugged for this test, because the results of the measurements can otherwise be distorted by the active CAN transceiver.

Fig. 72: Wiring diagram for test setup

## Test 3

Determine the resistance between CAN high and CAN low - at each device, if necessary.

If the measured value is greater than 65 Ohms, it indicates the absence of a terminating resistor or a break in a signal lead. If the measured value is less than 50 Ohms, look for a short circuit between the CAN lines, more than the correct number of terminating resistors, or faulty transceivers.

### Test 4

Check for a short circuit between the CAN ground and the signal leads, or between the screen and signal leads.

### Test 5

Remove the earth connection from the CAN ground and screen. Check for a short circuit between the CAN ground and screen.

### Topology

The possible cable length in CAN networks depends heavily on the selected baud rate. CAN will tolerate short drop lines - although this again depends on the baud rate. The maximum permitted drop line length should not be exceeded. The length of cable that has been installed is often underestimated - estimates can even be a factor of 10 less than the actual length. The following test is therefore recommended:

### Test 6

Measure the drop line lengths and the total bus length (a rough estimate is not sufficient) and compare the values with the topology rules (depending on the baud rate).

### Screening and earthing

The power supply and the screen should be carefully earthed at the power supply unit, once only and with low resistance. At all connecting points, branches and so forth the screen of the CAN cable (and possibly the CAN GND) must also be connected, as well as the signal leads. In the Beckhoff IP20 Bus Couplers, the screen is grounded for high frequencies via an R/C element.

## Test 7

Use a DC ammeter (16 A max.) to measure the current between the power supply ground and the screen at the end of the network most remote from the power supply unit. An equalization current should be present. If there is no current, then either the screen is not connected all the way through, or the power supply unit is not properly earthed. If the power supply unit is somewhere in the middle of the network, the measurement should be performed at both ends. When appropriate, this test can also be carried out at the ends of the drop line.

## Test 8

Interrupt the screen at a number of locations and measure the connection current. If current is flowing, the screen is earthed at more than one place, creating a ground loop.

### **Potential differences**

The screen must be connected all the way through for this test, and must not be carrying any current - this has previously been tested.

## Test 9

Measure and record the voltage between the screen and the power supply ground at each node. The maximum potential difference between any two devices should be less than 5 volts.

#### **Detect and localize faults**

The "low-tech approach" rule is the best localisation method: disconnect parts of the network, and observe when the fault disappears.

But: the approach based on this method is inadequate in the event of problems such as excessive potential differences, ground loops, EMC and signal corruption, since in many cases making the network smaller solves the problem notwithstanding the fact that the "missing" component may not have caused it. The bus load also changes as the network is reduced in size, which can mean that external interference "hits" CAN telegrams less often.

Diagnosis with an oscilloscope is not usually successful: even when they are in good condition, CAN signals can look really chaotic. It may be possible to trigger on error frames using a storage oscilloscope - this type of diagnosis, however, is only possible for expert technicians.

### Protocol problems

In rare cases, protocol problems (e.g. faulty or incomplete DeviceNet implementation, unfavorable timing at boot up, etc.) can be the cause of faults. In this case it is necessary to trace the bus traffic for evaluation by DeviceNet experts - the Beckhoff support team [ $\blacktriangleright$ \_118] can help here.

A free channel on a Beckhoff FC5102 CANopen PCI card is appropriate for such a trace - Beckhoff make the necessary trace software available on the internet. Alternatively, it is of course possible to use a normal commercial CAN analysis tool.

# 8 Appendix

## 8.1 EtherCAT AL Status Codes

For detailed information please refer to the EtherCAT system description.

## 8.2 Firmware compatibility

Beckhoff EtherCAT devices are delivered with the latest available firmware version. Compatibility of firmware and hardware is mandatory; not every combination ensures compatibility. The overview below shows the hardware versions on which a firmware can be operated.

## Note

- It is recommended to use the newest possible firmware for the respective hardware.
- Beckhoff is not under any obligation to provide customers with free firmware updates for delivered products.

## NOTICE

## Risk of damage to the device!

Pay attention to the instructions for firmware updates on the <u>separate page [▶ 105]</u>. If a device is placed in BOOTSTRAP mode for a firmware update, it does not check when downloading whether the new firmware is suitable. This can result in damage to the device! Therefore, always make sure that the firmware is suitable for the hardware version!

EL6752

\*) This is the current compatible firmware/hardware version at the time of the preparing this documentation. Check on the Beckhoff web page whether more up-to-date <u>documentation</u> is available.

## 8.3 Firmware Update EL/ES/EM/ELM/EP/EPP/ERPxxxx

This section describes the device update for Beckhoff EtherCAT slaves from the EL/ES, ELM, EM, EK, EP, EPP and ERP series. A firmware update should only be carried out after consultation with Beckhoff support.

## NOTICE

## Only use TwinCAT 3 software!

A firmware update of Beckhoff IO devices must only be performed with a TwinCAT 3 installation. It is recommended to build as up-to-date as possible, available for free download on the <u>Beckhoff website</u>.

To update the firmware, TwinCAT can be operated in the so-called FreeRun mode, a paid license is not required.

The device to be updated can usually remain in the installation location, but TwinCAT has to be operated in the FreeRun. Please make sure that EtherCAT communication is trouble-free (no LostFrames etc.).

Other EtherCAT master software, such as the EtherCAT Configurator, should not be used, as they may not support the complexities of updating firmware, EEPROM and other device components.

### Storage locations

An EtherCAT slave stores operating data in up to three locations:

• Each EtherCAT slave has a device description, consisting of identity (name, product code), timing specifications, communication settings, etc.

This device description (ESI; EtherCAT Slave Information) can be downloaded from the Beckhoff website in the download area as a <u>zip file</u> and used in EtherCAT masters for offline configuration, e.g. in TwinCAT.

Above all, each EtherCAT slave carries its device description (ESI) electronically readable in a local memory chip, the so-called **ESI EEPROM**. When the slave is switched on, this description is loaded locally in the slave and informs it of its communication configuration; on the other hand, the EtherCAT master can identify the slave in this way and, among other things, set up the EtherCAT communication accordingly.

## NOTICE

### Application-specific writing of the ESI-EEPROM

The ESI is developed by the device manufacturer according to ETG standard and released for the corresponding product.

- Meaning for the ESI file: Modification on the application side (i.e. by the user) is not permitted.

- Meaning for the ESI EEPROM: Even if a writeability is technically given, the ESI parts in the EEPROM and possibly still existing free memory areas must not be changed beyond the normal update process. Especially for cyclic memory processes (operating hours counter etc.), dedicated memory products such as EL6080 or IPC's own NOVRAM must be used.

- Depending on functionality and performance EtherCAT slaves have one or several local controllers for processing I/O data. The corresponding program is the so-called **firmware** in \*.efw format.
- In some EtherCAT slaves the EtherCAT communication may also be integrated in these controllers. In this case the controller is usually a so-called **FPGA** chip with \*.rbf firmware.

Customers can access the data via the EtherCAT fieldbus and its communication mechanisms. Acyclic mailbox communication or register access to the ESC is used for updating or reading of these data.

The TwinCAT System Manager offers mechanisms for programming all three parts with new data, if the slave is set up for this purpose. Generally the slave does not check whether the new data are suitable, i.e. it may no longer be able to operate if the data are unsuitable.

### Simplified update by bundle firmware

The update using so-called **bundle firmware** is more convenient: in this case the controller firmware and the ESI description are combined in a \*.efw file; during the update both the firmware and the ESI are changed in the terminal. For this to happen it is necessary

• for the firmware to be in a packed format: recognizable by the file name, which also contains the revision number, e.g. ELxxxx-xxxx\_REV0016\_SW01.efw

- for password=1 to be entered in the download dialog. If password=0 (default setting) only the firmware update is carried out, without an ESI update.
- for the device to support this function. The function usually cannot be retrofitted; it is a component of many new developments from year of manufacture 2016.

Following the update, its success should be verified

- ESI/Revision: e.g. by means of an online scan in TwinCAT ConfigMode/FreeRun this is a convenient way to determine the revision
- Firmware: e.g. by looking in the online CoE of the device

## NOTICE

## Risk of damage to the device!

- ✓ Note the following when downloading new device files
- a) Firmware downloads to an EtherCAT device must not be interrupted
- b) Flawless EtherCAT communication must be ensured. CRC errors or LostFrames must be avoided.
- c) The power supply must adequately dimensioned. The signal level must meet the specification.
- ⇒ In the event of malfunctions during the update process the EtherCAT device may become unusable and require re-commissioning by the manufacturer.

## 8.3.1 Device description ESI file/XML

## NOTICE

## Attention regarding update of the ESI description/EEPROM

Some slaves have stored calibration and configuration data from the production in the EEPROM. These are irretrievably overwritten during an update.

The ESI device description is stored locally on the slave and loaded on start-up. Each device description has a unique identifier consisting of slave name (9 characters/digits) and a revision number (4 digits). Each slave configured in the System Manager shows its identifier in the EtherCAT tab:

🕀 👧 SYSTEM - Configuration	Contract Charles		
📴 NC - Configuration	General EtherCAT	Process Data Startu	p CoE - Unline Unline
	Туре:	EL3204 4Ch. Ana. In	put PT100 (RTD)
😑 🏘 I/O Devices	Product/Revision:	EL3204-0000-0016	
ia- ा Device 2 (EtherCAT) Device 2-Image	Auto Inc Addr:	FFFF	
🕂 Device 2-Image-Info	EtherCAT Addr:	1002	Advanced Settings
ia⊷ 💱 Inputs ia⊷ 🛊 Outputs ia⊷ 🙀 InfoData	Previous Port:	Term 1 (EK1101) - B	
🖃 📲 Term 1 (EK1101)			
in the second s			
🕀 😵 WcState			

Fig. 73: Device identifier consisting of name EL3204-0000 and revision -0016

The configured identifier must be compatible with the actual device description used as hardware, i.e. the description which the slave has loaded on start-up (in this case EL3204). Normally the configured revision must be the same or lower than that actually present in the terminal network.

For further information on this, please refer to the EtherCAT system documentation.

## Update of XML/ESI description

The device revision is closely linked to the firmware and hardware used. Incompatible combinations lead to malfunctions or even final shutdown of the device. Corresponding updates should only be carried out in consultation with Beckhoff support.

### Display of ESI slave identifier

The simplest way to ascertain compliance of configured and actual device description is to scan the EtherCAT boxes in TwinCAT mode Config/FreeRun:

Fig. 74: Scan the subordinate field by right-clicking on the EtherCAT device

If the found field matches the configured field, the display shows

TwinCAT System Manager 🛛 🔯				
۰	al:			
	ок			

Fig. 75: Configuration is identical

otherwise a change dialog appears for entering the actual data in the configuration.

Check Configuration		(	×
Found Items:	Disable > Ignore > Delete > Copy Before > Copy After > Copy After > Copy After > Copy After > OK Cancel	Configured Items:	

Fig. 76: Change dialog

In this example in Fig. *Change dialog*, an EL3201-0000-**0017** was found, while an EL3201-0000-**0016** was configured. In this case the configuration can be adapted with the *Copy Before* button. The *Extended Information* checkbox must be set in order to display the revision.

## Changing the ESI slave identifier

The ESI/EEPROM identifier can be updated as follows under TwinCAT:

- Trouble-free EtherCAT communication must be established with the slave.
- The state of the slave is irrelevant.
- Right-clicking on the slave in the online display opens the *EEPROM Update* dialog, Fig. *EEPROM Update*

### Fig. 77: EEPROM Update

The new ESI description is selected in the following dialog, see Fig. *Selecting the new ESI*. The checkbox *Show Hidden Devices* also displays older, normally hidden versions of a slave.
DECKNULL	BE		KH	0	FF
----------	----	--	----	---	----

B EL3311 1Ch. Ana. Input Thermo	acouple (TC) (EL3311-0000-0017)	
EL3311 TCh. Ana. Input The	ermocouple (TC) (EL3311-0000-0015)	
🗄 📲 EL3312 2Ch. Ana. Input Thermo	ocouple (TC) (EL3312-0000-0017)	

### Fig. 78: Selecting the new ESI

A progress bar in the System Manager shows the progress. Data are first written, then verified.

The change only takes effect after a restart. Most EtherCAT devices read a modified ESI description immediately or after startup from the INIT. Some communication settings such as distributed clocks are only read during power-on. The EtherCAT slave therefore has to be switched off briefly in order for the change to take effect.

### 8.3.2 Firmware explanation

### Determining the firmware version

### Determining the version via the System Manager

The TwinCAT System Manager shows the version of the controller firmware if the master can access the slave online. Click on the E-Bus Terminal whose controller firmware you want to check (in the example terminal 2 (EL3204)) and select the tab *CoE Online* (CAN over EtherCAT).

### CoE Online and Offline CoE

Two CoE directories are available:

• online: This is offered in the EtherCAT slave by the controller, if the EtherCAT slave supports this. This CoE directory can only be displayed if a slave is connected and operational.

• offline: The EtherCAT Slave Information ESI/XML may contain the default content of the CoE. This CoE directory can only be displayed if it is included in the ESI (e.g. "Beckhoff EL5xxx.xml").

The Advanced button must be used for switching between the two views.

In Fig. *Display of EL3204 firmware version* the firmware version of the selected EL3204 is shown as 03 in CoE entry 0x100A.

Fig. 79: Display of EL3204 firmware version

In (A) TwinCAT 2.11 shows that the Online CoE directory is currently displayed. If this is not the case, the Online directory can be loaded via the Online option in Advanced Settings (B) and double-clicking on AllObjects.

#### 8.3.3 Updating controller firmware \*.efw

### **CoE directory**

The Online CoE directory is managed by the controller and stored in a dedicated EEPROM, which is generally not changed during a firmware update.

Switch to the Online tab to update the controller firmware of a slave, see Fig. Firmware Update.

Fig. 80: Firmware Update

Proceed as follows, unless instructed otherwise by Beckhoff support. Valid for TwinCAT 2 and 3 as EtherCAT master.

• Switch TwinCAT system to ConfigMode/FreeRun with cycle time >= 1 ms (default in ConfigMode is 4 ms). A FW-Update during real time operation is not recommended.

Microsoft Visual Studio	Microsoft Visual Studio
Load I/O Devices	Activate Free Run
Yes No	Yes No

• Switch EtherCAT Master to PreOP

- Switch slave to INT (A)
- Switch slave to BOOTSTRAP

- Check the current status (B, C)
- Download the new \*efw file (wait until it ends). A password will not be necessary usually.

- · After the download switch to INIT, then PreOP
- Switch off the slave briefly (don't pull under voltage!)
- Check within CoE 0x100A, if the FW status was correctly overtaken.

### 8.3.4 FPGA firmware \*.rbf

If an FPGA chip deals with the EtherCAT communication an update may be accomplished via an \*.rbf file.

- Controller firmware for processing I/O signals
- FPGA firmware for EtherCAT communication (only for terminals with FPGA)

The firmware version number included in the terminal serial number contains both firmware components. If one of these firmware components is modified this version number is updated.

### Determining the version via the System Manager

The TwinCAT System Manager indicates the FPGA firmware version. Click on the Ethernet card of your EtherCAT strand (Device 2 in the example) and select the *Online* tab.

The *Reg:0002* column indicates the firmware version of the individual EtherCAT devices in hexadecimal and decimal representation.

### Update

For updating the FPGA firmware

- of an EtherCAT coupler the coupler must have FPGA firmware version 11 or higher;
- of an E-Bus Terminal the terminal must have FPGA firmware version 10 or higher.

Older firmware versions can only be updated by the manufacturer!

### Updating an EtherCAT device

The following sequence order have to be met if no other specifications are given (e.g. by the Beckhoff support):

• Switch TwinCAT system to ConfigMode/FreeRun with cycle time >= 1 ms (default in ConfigMode is 4 ms). A FW-Update during real time operation is not recommended.

# BECKHOFF

 In the TwinCAT System Manager select the terminal for which the FPGA firmware is to be updated (in the example: Terminal 5: EL5001) and
 click the Advanced Settings button in the EtherCAT tob.

click the Advanced Settings button in the EtherCAT tab:

😎 TwinCAT System Manager				
<u>File Edit Actions View Options Help</u>

Ready			Local () Con	fig Mode //

• The *Advanced Settings* dialog appears. Under *ESC Access/E<sup>2</sup>PROM*/FPGA click on *Write FPGA* button:

• Select the file (\*.rbf) with the new FPGA firmware, and transfer it to the EtherCAT device:

Open	? ×
Search in: 🔁 FirmWare	] 🗿 🤣 📂 🖽 -
SocCOM_T1_EBUS_BGA_LVTTL_F2	_S4_BLD12.rbf
<u> </u>	
File name: A_LVTL_F2_S4_BLD12.rb	f Open
File type: FPGA File (*.rbf)	Cancel
	· //

- Wait until download ends
- Switch slave current less for a short time (don't pull under voltage!). In order to activate the new FPGA firmware a restart (switching the power supply off and on again) of the EtherCAT device is required.
- · Check the new FPGA status

### NOTICE

### Risk of damage to the device!

A download of firmware to an EtherCAT device must not be interrupted in any case! If you interrupt this process by switching off power supply or disconnecting the Ethernet link, the EtherCAT device can only be recommissioned by the manufacturer!

### 8.3.5 Simultaneous updating of several EtherCAT devices

The firmware and ESI descriptions of several devices can be updated simultaneously, provided the devices have the same firmware file/ESI.

Gener	al A	dapter Etł	herCAT	Online	CoE - Online

Fig. 84: Multiple selection and firmware update

Select the required slaves and carry out the firmware update in BOOTSTRAP mode as described above.

# 8.4 Abbreviations

Abbreviation	Description			
CAN	Controller Area Network. Serial bus system standardised in ISO 11898 that is used as the basic technology for CANopen			
CiA	CAN in Automation e.V An international association of manufacturers and users based in Erlangen, Germany.			
СоВ	Communication Object. A CAN telegram with up to 8 data bytes.			
CoB-ID	Communication Object Identifier. Telegram address (not to be confused with the node address). CANopen uses the 11-bit identifier according to CAN 2.0A.			
CoE	CANopen over EtherCAT			
ESC	EtherCAT Slave Controller			
FBM	Fieldbus master			
MC	Motion Control			
NMT	Network Management. One of the service primitives of the CANopen specification. Network management is used to initialize the network and to monitor nodes.			
OP	OPERATIONAL			
PDO	Process Data Object. A CAN telegram for the transfer of process data (e.g. I/O data).			
PREOP	PRE OPERATIONAL			
RxPDO	Receive PDO. PDOs are always identified from the point of view of the device under consideration. Thus a TxPDO with input data from an I/O module becomes an RxPDO from the controller's point of view.			
SAFEOP	SAFE OPERATIONAL			
SDO	Service Data Object. A CAN telegram with a protocol for communication with data in the object directory (typically parameter data).			
SI	Subindex			
SM	SyncManager			
SoE	Servo Profile over EtherCAT			
TxPDO	Transmit PDO (named from the point of view of the CAN node).			

## 8.5 Support and Service

Beckhoff and their partners around the world offer comprehensive support and service, making available fast and competent assistance with all questions related to Beckhoff products and system solutions.

### Beckhoff's branch offices and representatives

Please contact your Beckhoff branch office or representative for local support and service on Beckhoff products!

The addresses of Beckhoff's branch offices and representatives round the world can be found on her internet pages: <u>www.beckhoff.com</u>

You will also find further documentation for Beckhoff components there.

### Support

The Beckhoff Support offers you comprehensive technical assistance, helping you not only with the application of individual Beckhoff products, but also with other, wide-ranging services:

- support
- · design, programming and commissioning of complex automation systems
- and extensive training program for Beckhoff system components

Hotline:	+49 5246 963 157
e-mail:	support@beckhoff.com
web:	www.beckhoff.com/support

### Service

The Beckhoff Service Center supports you in all matters of after-sales service:

- · on-site service
- repair service
- · spare parts service
- hotline service

Hotline:	+49 5246 963 460
e-mail:	service@beckhoff.com
web:	www.beckhoff.com/service

### **Headquarters Germany**
